

IsarMathLib

Ślawomir Kołodziej, Daniel de la Concepción Sáez

October 2, 2021

Abstract

This is the proof document of the IsarMathLib project version 1.22.0. IsarMathLib is a library of formalized mathematics for Isabelle2021 (ZF logic).

Contents

1	Introduction to the IsarMathLib project	10
1.1	How to read IsarMathLib proofs - a tutorial	10
1.2	Overview of the project	12
2	First Order Logic	16
2.1	Notions and lemmas in FOL	16
3	ZF set theory basics	19
3.1	Lemmas in Zermelo-Fraenkel set theory	19
4	Natural numbers in IsarMathLib	26
4.1	Induction	26
4.2	Intervals	31
5	Order relations - introduction	33
5.1	Definitions	33
5.2	Intervals	36
5.3	Bounded sets	38
6	More on order relations	44
6.1	Definitions and basic properties	45
6.2	Properties of (strict) total orders	47
7	Even more on order relations	49
7.1	Maximum and minimum of a set	50
7.2	Supremum and Infimum	57
7.3	Strict versions of order relations	65

8	Functions - introduction	68
8.1	Properties of functions, function spaces and (inverse) images.	68
8.2	Functions restricted to a set	83
8.3	Constant functions	85
8.4	Injections, surjections, bijections etc.	85
8.5	Functions of two variables	93
9	Semilattices and Lattices	97
9.1	Semilattices	98
10	Order on natural numbers	104
10.1	Order on natural numbers	104
11	Binary operations	105
11.1	Lifting operations to a function space	105
11.2	Associative and commutative operations	107
11.3	Restricting operations	110
11.4	Compositions	112
11.5	Identity function	114
11.6	Lifting to subsets	115
11.7	Distributive operations	120
12	More on functions	121
12.1	Functions and order	121
12.2	Functions in cartesian products	126
12.3	Induced relations and order isomorphisms	127
13	Finite sets - introduction	135
13.1	Definition and basic properties of finite powerset	135
14	Finite sets	144
14.1	Finite powerset	144
14.2	Finite range functions	152
15	Finite sets 1	153
15.1	Finite vs. bounded sets	153
16	Finite sets and order relations	156
16.1	Finite vs. bounded sets	157
16.2	Order isomorphisms of finite sets	158
17	Equivalence relations	164
17.1	Congruent functions and projections on the quotient	164
17.2	Projecting commutative, associative and distributive operations.	170

17.3 Saturated sets	173
18 Finite sequences	175
18.1 Lists as finite sequences	175
18.2 Lists and cartesian products	189
19 Inductive sequences	192
19.1 Sequences defined by induction	192
19.2 Images of inductive sequences	200
19.3 Subsets generated by a binary operation	200
19.4 Inductive sequences with changing generating function	203
20 Enumerations	207
20.1 Enumerations: definition and notation	207
20.2 Properties of enumerations	208
21 Folding in ZF	210
21.1 Folding in ZF	211
22 Partitions of sets	215
22.1 Bisections	215
22.2 Partitions	218
23 Quasigroups	219
23.1 Definitions and notation	219
24 Loops	222
24.1 Definitions and notation	222
25 Ordered loops	225
25.1 Definition and notation	225
26 Semigroups	230
26.1 Products of sequences of semigroup elements	230
26.2 Products over sets of indices	234
26.3 Commutative semigroups	237
27 Commutative Semigroups	249
27.1 Sum of a function over a set	249
28 Monoids	253
28.1 Definition and basic properties	253

29 Groups - introduction	258
29.1 Definition and basic properties of groups	258
29.2 Subgroups	270
29.3 Groups vs. loops	277
30 Groups 1	279
30.1 Translations	279
30.2 Odd functions	287
30.3 Subgroups and interval arithmetic	288
31 Groups - and alternative definition	293
31.1 An alternative definition of group	294
32 Abelian Group	295
32.1 Rearrangement formulae	296
33 Groups 2	308
33.1 Lifting groups to function spaces	308
33.2 Equivalence relations on groups	313
33.3 Normal subgroups and quotient groups	316
33.4 Function spaces as monoids	321
34 Groups 3	322
34.1 Group valued finite range functions	322
34.2 Almost homomorphisms	324
34.3 The classes of almost homomorphisms	332
34.4 Compositions of almost homomorphisms	335
34.5 Shifting almost homomorphisms	344
35 Direct product	345
35.1 Definition	345
35.2 Associative and commutative operations	346
36 Ordered groups - introduction	347
36.1 Ordered groups	347
36.2 Inequalities	353
36.3 The set of positive elements	365
36.4 Intervals and bounded sets	373
37 More on ordered groups	378
37.1 Absolute value and the triangle inequality	379
37.2 Maximum absolute value of a set	391
37.3 Alternative definitions	392
37.4 Odd Extensions	396
37.5 Functions with infinite limits	398

38 Rings - introduction	402
38.1 Definition and basic properties	402
38.2 Rearrangement lemmas	409
39 More on rings	412
39.1 The ring of classes of almost homomorphisms	412
40 Ordered rings	415
40.1 Definition and notation	415
40.2 Absolute value for ordered rings	423
40.3 Positivity in ordered rings	425
41 Cardinal numbers	432
41.1 Some new ideas on cardinals	432
41.2 Main result on cardinals (without the Axiom of Choice) . . .	436
41.3 Choice axioms	440
42 Groups 4	444
42.1 Conjugation of subgroups	444
42.2 Finite groups	449
42.3 Subgroups generated by sets	453
42.4 Homomorphisms	454
42.5 First isomorphism theorem	460
43 Fields - introduction	468
43.1 Definition and basic properties	468
43.2 Equations and identities	471
43.3 $1/0=0$	473
44 Ordered fields	474
44.1 Definition and basic properties	474
44.2 Inequalities	478
44.3 Definition of real numbers	481
45 Integers - introduction	481
45.1 Addition and multiplication as ZF-functions.	481
45.2 Integers as an ordered group	488
45.3 Induction on integers.	501
45.4 Bounded vs. finite subsets of integers	504
46 Integers 1	507
46.1 Integers as a ring	507
46.2 Rearrangement lemmas	510
46.3 Integers as an ordered ring	516
46.4 Maximum and minimum of a set of integers	527

46.5	The set of nonnegative integers	531
46.6	Functions with infinite limits	537
46.7	Miscellaneous	542
47	Division on integers	544
47.1	Quotient and remainder	544
48	Integers 2	546
48.1	Slopes	546
48.2	Composing slopes	569
49	Integers 3	574
49.1	Positive slopes	574
49.2	Inverting slopes	585
49.3	Completeness	594
50	Construction real numbers - the generic part	599
50.1	The definition of real numbers	600
51	Construction of real numbers	607
51.1	Definitions and notation	608
51.2	Multiplication of real numbers	610
51.3	The order on reals	614
51.4	Inverting reals	623
51.5	Completeness	626
52	Topology - introduction	646
52.1	Basic definitions and properties	646
52.2	Interior of a set	650
52.3	Closed sets, closure, boundary.	652
53	Topology 1	657
53.1	Separation axioms.	657
53.2	Bases and subbases.	659
53.3	Product topology	663
54	Metric spaces	668
54.1	Pseudometric - definition and basic properties	668
55	Basic properties of real numbers	671
55.1	Basic notation for real numbers	672
56	Complex numbers	676
56.1	From complete ordered fields to complex numbers	677
56.2	Axioms of complex numbers	680

57 Topology 1b	693
57.1 Compact sets are closed - no need for AC	694
58 Topology 2	695
58.1 Continuous functions.	696
58.2 Homeomorphisms	701
58.3 Topologies induced by mappings	703
58.4 Partial functions and continuity	705
58.5 Product topology and continuity	707
58.6 Pasting lemma	710
59 Topology 3	713
59.1 The base of the product topology	713
59.2 Finite product of topologies	716
60 Topology 4	724
60.1 Nets	725
60.2 Filters	728
60.3 Relation between nets and filters	734
61 Topology and neighborhoods	745
61.1 Neighborhood systems	745
61.2 Topology from neighborhood systems	746
61.3 Neighborhood system from topology	747
62 Topology - examples	749
62.1 CoCardinal Topology	750
62.2 Total set, Closed sets, Interior, Closure and Boundary	751
62.3 Excluded Set Topology	758
62.4 Total set, closed sets, interior, closure and boundary	759
62.5 Special cases and subspaces	762
62.6 Included Set Topology	764
62.7 Basic topological notions in included set topology	765
62.8 Special cases and subspaces	768
63 More examples in topology	769
63.1 New ideas using a base for a topology	770
63.2 The topology of a base	770
63.3 Dual Base for Closed Sets	774
63.4 Partition topology	776
63.5 Partition topology is a topology.	777
63.6 Total set, Closed sets, Interior, Closure and Boundary	778
63.7 Special cases and subspaces	783
63.8 Order topologies	785
63.9 Order topology is a topology	785

63.10	Total set	797
63.11	Right order and Left order topologies.	798
63.11.1	Right and Left Order topologies are topologies	798
63.11.2	Total set	799
63.12	Union of Topologies	799
64	Properties in Topology	801
64.1	Properties of compactness	801
64.2	Properties of numerability	806
64.3	Relations between numerability properties and choice principles	807
64.4	Relation between numerability and compactness	813
65	Topology 5	827
65.1	Some results for separation axioms	827
65.2	Hereditability	843
65.3	Spectrum and anti-properties	847
66	Topology 6	877
66.1	Image filter	877
66.2	Continuous at a point vs. globally continuous	879
66.3	Continuous functions and filters	880
67	Topology 7	882
67.1	Connection Properties	882
68	Topology 8	914
68.1	Definition of quotient topology	914
68.2	Quotient topologies from equivalence relations	916
69	Topology 9	924
69.1	Group of homeomorphisms	924
69.2	Examples computed	926
69.3	Properties preserved by functions	939
70	Topology 10	943
70.1	Closure and closed sets in product space	943
70.2	Separation properties in product space	946
70.3	Connection properties in product space	950
71	Topology 11	955
71.1	Order topologies	955
71.2	Separation properties	955
71.3	Connectedness properties	957
71.4	Numerability axioms	977

72 Properties in topology 2	986
72.1 Local properties.	986
72.2 First examples	986
72.3 Local compactness	987
72.4 Compactification by one point	996
72.5 Hereditary properties and local properties	1006
73 Properties in Topology 3	1039
73.1 More anti-properties	1039
73.2 First examples	1040
73.3 Structural results	1040
73.4 More Separation properties	1051
73.5 Definitions	1051
73.6 First results	1051
73.7 Counter-examples	1058
73.8 Other types of properties	1098
73.9 Definitions	1098
73.10 First examples	1099
73.11 Structural results	1103
74 Uniform spaces	1106
74.1 Definition and motivation	1106
75 More on uniform spaces	1111
75.1 Uniformly continuous functions	1112
76 Alternative definitions of uniformity	1113
76.1 Uniform covers	1113
77 Topological groups - introduction	1128
77.1 Topological group: definition and notation	1128
77.2 Interval arithmetic, translations and inverse of set	1133
77.3 Neighborhoods of zero	1136
77.4 Closure in topological groups	1141
77.5 Sums of sequences of elements and subsets	1143
78 Topological groups 1	1146
78.1 Separation properties of topological groups	1146
78.2 Existence of nice neighbourhoods.	1149
78.3 Rest of separation axioms	1149
78.4 Local properties	1154
79 Topological groups - uniformity	1156

1 Introduction to the IsarMathLib project

```
theory Introduction imports ZF.equalities
```

```
begin
```

This theory does not contain any formalized mathematics used in other theories, but is an introduction to IsarMathLib project.

1.1 How to read IsarMathLib proofs - a tutorial

Isar (the Isabelle’s formal proof language) was designed to be similar to the standard language of mathematics. Any person able to read proofs in a typical mathematical paper should be able to read and understand Isar proofs without having to learn a special proof language. However, Isar is a formal proof language and as such it does contain a couple of constructs whose meaning is hard to guess. In this tutorial we will define a notion and prove an example theorem about that notion, explaining Isar syntax along the way. This tutorial may also serve as a style guide for IsarMathLib contributors. Note that this tutorial aims to help in reading the presentation

of the Isar language that is used in IsarMathLib proof document and HTML rendering on the FormalMath.org site, but does not teach how to write proofs that can be verified by Isabelle. This presentation is different than the source processed by Isabelle (the concept that the source and presentation look different should be familiar to any LaTeX user). To learn how to write Isar proofs one needs to study the source of this tutorial as well.

The first thing that mathematicians typically do is to define notions. In Isar this is done with the `definition` keyword. In our case we define a notion of two sets being disjoint. We will use the infix notation, i.e. the string `{is disjoint with}` put between two sets to denote our notion of disjointness. The left side of the \equiv symbol is the notion being defined, the right side says how we define it. In Isabelle/ZF `0` is used to denote both zero (of natural numbers) and the empty set, which is not surprising as those two things are the same in set theory.

definition

```
AreDisjoint (infix {is disjoint with} 90) where
  A {is disjoint with} B  $\equiv$  A  $\cap$  B = 0
```

We are ready to prove a theorem. Here we show that the relation of being disjoint is symmetric. We start with one of the keywords "theorem", "lemma" or "corollary". In Isar they are synonymous. Then we provide a name for the theorem. In standard mathematics theorems are numbered. In Isar we can do that too, but it is considered better to give theorems meaningful names. After the "shows" keyword we give the statement to show. The \longleftrightarrow symbol denotes the equivalence in Isabelle/ZF. Here we want to show that "A is disjoint with B iff and only if B is disjoint with A". To prove this fact we show two implications - the first one that A `{is disjoint with}` B implies B `{is disjoint with}` A and then the converse one. Each of these implications is formulated as a statement to be proved and then proved in a subproof like a mini-theorem. Each subproof uses a proof block to show the implication. Proof blocks are delimited with curly brackets in Isar. Proof block is one of the constructs that does not exist in informal mathematics, so it may be confusing. When reading a proof containing a proof block I suggest to focus first on what is that we are proving in it. This can be done by looking at the first line or two of the block and then at the last statement. In our case the block starts with "assume A `{is disjoint with}` B" and the last statement is "then have B `{is disjoint with}` A". It is a typical pattern when someone needs to prove an implication: one assumes the antecedent and then shows that the consequent follows from this assumption. Implications are denoted with the \longrightarrow symbol in Isabelle. After we prove both implications we collect them using the "moreover" construct. The keyword "ultimately" indicates that what follows is the conclusion of the statements collected with "moreover". The "show" keyword is like "have", except that it indicates that we have arrived at the claim of the theorem (or a subproof).

```

theorem disjointness_symmetric:
  shows A {is disjoint with} B  $\longleftrightarrow$  B {is disjoint with} A
proof -
  have A {is disjoint with} B  $\longrightarrow$  B {is disjoint with} A
  proof -
    { assume A {is disjoint with} B
      then have A  $\cap$  B = 0 using AreDisjoint_def by simp
      hence B  $\cap$  A = 0 by auto
      then have B {is disjoint with} A
        using AreDisjoint_def by simp
    } thus thesis by simp
  qed
moreover have B {is disjoint with} A  $\longrightarrow$  A {is disjoint with} B
proof -
  { assume B {is disjoint with} A

1.2 Overview of the project

The `Fo11`, `ZF1` and `Nat_ZF_IML` theory files contain some background material that is needed for the remaining theories.

`Order_ZF` and `Order_ZF_1a` reformulate material from standard Isabelle's `Order` theory in terms of non-strict (less-or-equal) order relations. `Order_ZF_1` on the other hand directly continues the `Order` theory file using strict order relations (less and not equal). This is useful for translating theorems from Metamath.

In `NatOrder_ZF` we prove that the usual order on natural numbers is linear. The `func1` theory provides basic facts about functions. `func_ZF` continues this development with more advanced topics that relate to algebraic properties of binary operations, like lifting a binary operation to a function space, associative, commutative and distributive operations and properties of functions related to order relations. `func_ZF_1` is about properties of functions related to order relations.

The standard Isabelle's `Finite` theory defines the finite powerset of a set as a certain "datatype" (?) with some recursive properties. `IsarMathLib`'s `Finite1` and `Finite_ZF_1` theories develop more facts about this notion. These two theories are obsolete now. They will be gradually replaced by an approach based on set theory rather than tools specific to Isabelle. This approach is presented in `Finite_ZF` theory file.

In `FinOrd_ZF` we talk about ordered finite sets.

The `EquivClass1` theory file is a reformulation of the material in the standard Isabelle's `EquivClass` theory in the spirit of ZF set theory.

`FiniteSeq_ZF` discusses the notion of finite sequences (a.k.a. lists).

`InductiveSeq_ZF` provides the definition and properties of (what is known in basic calculus as) sequences defined by induction, i. e. by a formula of the form $a_0 = x$, $a_{n+1} = f(a_n)$.

`Fold_ZF` shows how the familiar from functional programming notion of fold can be interpreted in set theory.

`Partitions_ZF` is about splitting a set into non-overlapping subsets. This is a common trick in proofs.

`Semigroup_ZF` treats the expressions of the form $a_0 \cdot a_1 \cdot \dots \cdot a_n$, (i.e. products of finite sequences), where \cdot is an associative binary operation.

`CommutativeSemigroup_ZF` is another take on a similar subject. This time we consider the case when the operation is commutative and the result of depends only on the set of elements we are summing (additively speaking), but not the order.

The `Topology_ZF` series covers basics of general topology: interior, closure, boundary, compact sets, separation axioms and continuous functions.

`Group_ZF`, `Group_ZF_1`, `Group_ZF_1b` and `Group_ZF_2` provide basic facts of the group theory. `Group_ZF_3` considers the notion of almost homomorphisms that is needed for the real numbers construction in `Real_ZF`.

The `TopologicalGroup` connects the `Topology_ZF` and `Group_ZF` series and starts the subject of topological groups with some basic definitions and facts.

In `DirectProduct_ZF` we define direct product of groups and show some its basic properties.

The `OrderedGroup_ZF` theory treats ordered groups. This is a surprisingly large theory for such relatively obscure topic.

`Ring_ZF` defines rings. `Ring_ZF_1` covers the properties of rings that are specific to the real numbers construction in `Real_ZF`.

The `OrderedRing_ZF` theory looks at the consequences of adding a linear order to the ring algebraic structure.

`Field_ZF` and `OrderedField_ZF` contain basic facts about (you guessed it) fields and ordered fields.

`Int_ZF_IML` theory considers the integers as a monoid (multiplication) and an abelian ordered group (addition). In `Int_ZF_1` we show that integers form a commutative ring. `Int_ZF_2` contains some facts about slopes (almost homomorphisms on integers) needed for real numbers construction, used in `Real_ZF_1`.

In the `IntDiv_ZF_IML` theory we translate some properties of the integer quotient and remainder functions studied in the standard Isabelle's `IntDiv_ZF`

theory to the notation used in IsarMathLib.

The `Real_ZF` and `Real_ZF_1` theories contain the construction of real numbers based on the paper [2] by R. D. Arthan (not Cauchy sequences, not Dedekind sections). The heavy lifting is done mostly in `Group_ZF_3`, `Ring_ZF_1` and `Int_ZF_2`. `Real_ZF` contains the part of the construction that can be done starting from generic abelian groups (rather than additive group of integers). This allows to show that real numbers form a ring. `Real_ZF_1` continues the construction using properties specific to the integers and showing that real numbers constructed this way form a complete ordered field.

`Cardinal_ZF` provides a couple of theorems about cardinals that are mostly used for studying properties of topological properties (yes, this is kind of meta). The main result (proven without AC) is that if two sets can be injectively mapped into an infinite cardinal, then so can be their union. There is also a definition of the Axiom of Choice specific for a given cardinal (so that the choice function exists for families of sets of given cardinality). Some properties are proven for such predicates, like that for finite families of sets the choice function always exists (in ZF) and that the axiom of choice for a larger cardinal implies one for a smaller cardinal.

`Group_ZF_4` considers conjugate of subgroup and defines simple groups. A nice theorem here is that endomorphisms of an abelian group form a ring. The first isomorphism theorem (a group homomorphism h induces an isomorphism between the group divided by the kernel of h and the image of h) is proven.

Turns out given a property of a topological space one can define a local version of a property in general. This is studied in the `Topology_ZF_properties_2` theory and applied to local versions of the property of being finite or compact or Hausdorff (i.e. locally finite, locally compact, locally Hausdorff). There are a couple of nice applications, like one-point compactification that allows to show that every locally compact Hausdorff space is regular. Also there are some results on the interplay between hereditability of a property and local properties.

For a given surjection $f : X \rightarrow Y$, where X is a topological space one can consider the weakest topology on Y which makes f continuous, let's call it a quotient topology generated by f . The quotient topology generated by an equivalence relation r on X is actually a special case of this setup, where f is the natural projection of X on the quotient X/r . The properties of these two ways of getting new topologies are studied in `Topology_ZF_8` theory. The main result is that any quotient topology generated by a function is homeomorphic to a topology given by an equivalence relation, so these two approaches to quotient topologies are kind of equivalent.

As we all know, automorphisms of a topological space form a group. This fact is proven in `Topology_ZF_9` and the automorphism groups for co-cardinal,

included-set, and excluded-set topologies are identified. For order topologies it is shown that order isomorphisms are homeomorphisms of the topology induced by the order. Properties preserved by continuous functions are studied and as an application it is shown for example that quotient topological spaces of compact (or connected) spaces are compact (or connected, resp.)

The `Topology_ZF_10` theory is about products of two topological spaces. It is proven that if two spaces are T_0 (or T_1 , T_2 , regular, connected) then their product is as well.

Given a total order on a set one can define a natural topology on it generated by taking the rays and intervals as the base. The `Topology_ZF_11` theory studies relations between the order and various properties of generated topology. For example one can show that if the order topology is connected, then the order is complete (in the sense that for each set bounded from above the set of upper bounds has a minimum). For a given cardinal κ we can consider generalized notion of κ -separability. Turns out κ -separability is related to (order) density of sets of cardinality κ for order topologies.

Being a topological group imposes additional structure on the topology of the group, in particular its separation properties. In `Topological_Group_ZF_1.thy` theory it is shown that if a topology is T_0 , then it must be T_3 , and that the topology in a topological group is always regular.

For a given normal subgroup of a topological group we can define a topology on the quotient group in a natural way. At the end of the `Topological_Group_ZF_2.thy` theory it is shown that such topology on the quotient group makes it a topological group.

The `Topological_Group_ZF_3.thy` theory studies the topologies on subgroups of a topological group. A couple of nice basic properties are shown, like that the closure of a subgroup is a subgroup, closure of a normal subgroup is normal and, a bit more surprising (to me) property that every locally-compact subgroup of a T_0 group is closed.

In `Complex_ZF` we construct complex numbers starting from a complete ordered field (a model of real numbers). We also define the notation for writing about complex numbers and prove that the structure of complex numbers constructed there satisfies the axioms of complex numbers used in `Metamath`.

`MMI_prelude` defines the `mmisar0` context in which most theorems translated from `Metamath` are proven. It also contains a chapter explaining how the translation works.

In the `Metamath_interface` theory we prove a theorem that the `mmisar0` context is valid (can be used) in the `complex0` context. All theories using the translated results will import the `Metamath_interface` theory. The `Metamath_sampler` theory provides some examples of using the translated theorems in the `complex0` context.

The theories `MMI_logic_and_sets`, `MMI_Complex`, `MMI_Complex_1` and `MMI_Complex_2` contain the theorems imported from the Metamath's `set.mm` database. As the translated proofs are rather verbose these theories are not printed in this proof document. The full list of translated facts can be found in the `Metamath_theorems.txt` file included in the `IsarMathLib` distribution. The `MMI_examples` provides some theorems imported from Metamath that are printed in this proof document as examples of how translated proofs look like.

`end`

2 First Order Logic

`theory FOL1 imports ZF.Tranc1`

`begin`

Isabelle/ZF builds on the first order logic. Almost everything one would like to have in this area is covered in the standard Isabelle libraries. The material in this theory provides some lemmas that are missing or allow for a more readable proof style.

2.1 Notions and lemmas in FOL

This section contains mostly shortcuts and workarounds that allow to use more readable coding style.

The next lemma serves as a workaround to problems with applying the definition of transitivity (of a relation) in our coding style (any attempt to do something like `using trans_def` puts Isabelle in an infinite loop).

`lemma FOL1_L2: assumes`

`A1: $\forall x\ y\ z. \langle x, y \rangle \in r \wedge \langle y, z \rangle \in r \longrightarrow \langle x, z \rangle \in r$`
`shows trans(r)`

`proof -`

`from A1 have`

`$\forall x\ y\ z. \langle x, y \rangle \in r \longrightarrow \langle y, z \rangle \in r \longrightarrow \langle x, z \rangle \in r$`
`using imp_conj by blast`

`then show thesis unfolding trans_def by blast`

`qed`

Another workaround for the problem of Isabelle simplifier looping when the transitivity definition is used.

`lemma FOL1_L3: assumes A1: trans(r) and A2: $\langle a, b \rangle \in r \wedge \langle b, c \rangle \in r$`
`shows $\langle a, c \rangle \in r$`

`proof -`

`from A1 have $\forall x\ y\ z. \langle x, y \rangle \in r \longrightarrow \langle y, z \rangle \in r \longrightarrow \langle x, z \rangle \in r$`
`unfolding trans_def by blast`

```

    with A2 show thesis using imp_conj by fast
qed

```

There is a problem with application of the definition of asymetry for relations. The next lemma is a workaround.

```

lemma Fol1_L4:
  assumes A1: antisym(r) and A2:  $\langle a,b \rangle \in r \quad \langle b,a \rangle \in r$ 
  shows a=b
proof -
  from A1 have  $\forall x y. \langle x,y \rangle \in r \longrightarrow \langle y,x \rangle \in r \longrightarrow x=y$ 
    unfolding antisym_def by blast
  with A2 show a=b using imp_conj by fast
qed

```

The definition below implements a common idiom that states that (perhaps under some assumptions) exactly one of given three statements is true.

```

definition
  Exactly_1_of_3_holds(p,q,r)  $\equiv$ 
   $(p \vee q \vee r) \wedge (p \longrightarrow \neg q \wedge \neg r) \wedge (q \longrightarrow \neg p \wedge \neg r) \wedge (r \longrightarrow \neg p \wedge \neg q)$ 

```

The next lemma allows to prove statements of the form `Exactly_1_of_3_holds(p,q,r)`.

```

lemma Fol1_L5:
  assumes p $\vee$ q $\vee$ r
  and p  $\longrightarrow$   $\neg$ q  $\wedge$   $\neg$ r
  and q  $\longrightarrow$   $\neg$ p  $\wedge$   $\neg$ r
  and r  $\longrightarrow$   $\neg$ p  $\wedge$   $\neg$ q
  shows Exactly_1_of_3_holds(p,q,r)
proof -
  from assms have
     $(p \vee q \vee r) \wedge (p \longrightarrow \neg q \wedge \neg r) \wedge (q \longrightarrow \neg p \wedge \neg r) \wedge (r \longrightarrow \neg p \wedge \neg q)$ 
    by blast
  then show Exactly_1_of_3_holds (p,q,r)
    unfolding Exactly_1_of_3_holds_def by fast
qed

```

If exactly one of p, q, r holds and p is not true, then q or r .

```

lemma Fol1_L6:
  assumes A1:  $\neg$ p and A2: Exactly_1_of_3_holds(p,q,r)
  shows q $\vee$ r
proof -
  from A2 have
     $(p \vee q \vee r) \wedge (p \longrightarrow \neg q \wedge \neg r) \wedge (q \longrightarrow \neg p \wedge \neg r) \wedge (r \longrightarrow \neg p \wedge \neg q)$ 
    unfolding Exactly_1_of_3_holds_def by fast
  hence p  $\vee$  q  $\vee$  r by blast
  with A1 show q  $\vee$  r by simp
qed

```

If exactly one of p, q, r holds and q is true, then r can not be true.

```

lemma Fol1_L7:
  assumes A1: q and A2: Exactly_1_of_3_holds(p,q,r)
  shows ¬r
proof -
  from A2 have
    (p∨q∨r) ∧ (p ⟶ ¬q ∧ ¬r) ∧ (q ⟶ ¬p ∧ ¬r) ∧ (r ⟶ ¬p ∧ ¬q)
    unfolding Exactly_1_of_3_holds_def by fast
  with A1 show ¬r by blast
qed

```

The next lemma demonstrates an elegant form of the Exactly_1_of_3_holds(p,q,r) predicate.

```

lemma Fol1_L8:
  shows Exactly_1_of_3_holds(p,q,r) ⟷ (p⟷q⟷r) ∧ ¬(p∧q∧r)
proof
  assume Exactly_1_of_3_holds(p,q,r)
  then have
    (p∨q∨r) ∧ (p ⟶ ¬q ∧ ¬r) ∧ (q ⟶ ¬p ∧ ¬r) ∧ (r ⟶ ¬p ∧ ¬q)
    unfolding Exactly_1_of_3_holds_def by fast
  thus (p⟷q⟷r) ∧ ¬(p∧q∧r) by blast
next assume (p⟷q⟷r) ∧ ¬(p∧q∧r)
  hence
    (p∨q∨r) ∧ (p ⟶ ¬q ∧ ¬r) ∧ (q ⟶ ¬p ∧ ¬r) ∧ (r ⟶ ¬p ∧ ¬q)
    by auto
  then show Exactly_1_of_3_holds(p,q,r)
    unfolding Exactly_1_of_3_holds_def by fast
qed

```

A property of the Exactly_1_of_3_holds predicate.

```

lemma Fol1_L8A: assumes A1: Exactly_1_of_3_holds(p,q,r)
  shows p ⟷ ¬(q ∨ r)
proof -
  from A1 have (p∨q∨r) ∧ (p ⟶ ¬q ∧ ¬r) ∧ (q ⟶ ¬p ∧ ¬r) ∧ (r ⟶ ¬p ∧ ¬q)
  unfolding Exactly_1_of_3_holds_def by fast
  then show p ⟷ ¬(q ∨ r) by blast
qed

```

Exclusive or definition. There is one also defined in the standard Isabelle, denoted xor, but it relates to boolean values, which are sets. Here we define a logical functor.

```

definition
  Xor (infixl Xor 66) where
  p Xor q ≡ (p∨q) ∧ ¬(p ∧ q)

```

The "exclusive or" is the same as negation of equivalence.

```

lemma Fol1_L9: shows p Xor q ⟷ ¬(p⟷q)
  using Xor_def by auto

```

Equivalence relations are symmetric.

```
lemma equiv_is_sym: assumes A1: equiv(X,r) and A2:  $\langle x,y \rangle \in r$ 
  shows  $\langle y,x \rangle \in r$ 
proof -
  from A1 have sym(r) using equiv_def by simp
  then have  $\forall x y. \langle x,y \rangle \in r \longrightarrow \langle y,x \rangle \in r$ 
    unfolding sym_def by fast
  with A2 show  $\langle y,x \rangle \in r$  by blast
qed
```

end

3 ZF set theory basics

```
theory ZF1 imports ZF.Perm
```

```
begin
```

The standard Isabelle distribution contains lots of facts about basic set theory. This theory file adds some more.

3.1 Lemmas in Zermelo-Fraenkel set theory

Here we put lemmas from the set theory that we could not find in the standard Isabelle distribution.

If one collection is contained in another, then we can say the same about their unions.

```
lemma collection_contain: assumes  $A \subseteq B$  shows  $\bigcup A \subseteq \bigcup B$ 
proof
  fix x assume  $x \in \bigcup A$ 
  then obtain X where  $x \in X$  and  $X \in A$  by auto
  with assms show  $x \in \bigcup B$  by auto
qed
```

If all sets of a nonempty collection are the same, then its union is the same.

```
lemma ZF1_1_L1: assumes  $C \neq 0$  and  $\forall y \in C. b(y) = A$ 
  shows  $(\bigcup y \in C. b(y)) = A$  using assms by blast
```

The union of all values of a constant meta-function belongs to the same set as the constant.

```
lemma ZF1_1_L2: assumes A1:  $C \neq 0$  and A2:  $\forall x \in C. b(x) \in A$ 
  and A3:  $\forall x y. x \in C \wedge y \in C \longrightarrow b(x) = b(y)$ 
  shows  $(\bigcup x \in C. b(x)) \in A$ 
proof -
  from A1 obtain x where D1:  $x \in C$  by auto
```

```

with A3 have  $\forall y \in C. b(y) = b(x)$  by blast
with A1 have  $(\bigcup y \in C. b(y)) = b(x)$ 
  using ZF1_1_L1 by simp
with D1 A2 show thesis by simp
qed

```

If two meta-functions are the same on a cartesian product, then the subsets defined by them are the same. I am surprised Isabelle can not handle this automatically.

```

lemma ZF1_1_L4: assumes A1:  $\forall x \in X. \forall y \in Y. a(x,y) = b(x,y)$ 
  shows  $\{a(x,y). \langle x,y \rangle \in X \times Y\} = \{b(x,y). \langle x,y \rangle \in X \times Y\}$ 
proof
  show  $\{a(x,y). \langle x,y \rangle \in X \times Y\} \subseteq \{b(x,y). \langle x,y \rangle \in X \times Y\}$ 
  proof
    fix z assume z  $\in \{a(x,y). \langle x,y \rangle \in X \times Y\}$ 
    with A1 show z  $\in \{b(x,y). \langle x,y \rangle \in X \times Y\}$  by auto
  qed
  show  $\{b(x,y). \langle x,y \rangle \in X \times Y\} \subseteq \{a(x,y). \langle x,y \rangle \in X \times Y\}$ 
  proof
    fix z assume z  $\in \{b(x,y). \langle x,y \rangle \in X \times Y\}$ 
    with A1 show z  $\in \{a(x,y). \langle x,y \rangle \in X \times Y\}$  by auto
  qed
qed

```

If two meta-functions are the same on a cartesian product, then the subsets defined by them are the same. This is similar to ZF1_1_L4, except that the set definition varies over $p \in X \times Y$ rather than $\langle x,y \rangle \in X \times Y$.

```

lemma ZF1_1_L4A: assumes A1:  $\forall x \in X. \forall y \in Y. a(\langle x,y \rangle) = b(x,y)$ 
  shows  $\{a(p). p \in X \times Y\} = \{b(x,y). \langle x,y \rangle \in X \times Y\}$ 
proof
  { fix z assume z  $\in \{a(p). p \in X \times Y\}$ 
    then obtain p where D1: z=a(p) p $\in X \times Y$  by auto
    let x = fst(p) let y = snd(p)
    from A1 D1 have z  $\in \{b(x,y). \langle x,y \rangle \in X \times Y\}$  by auto
  } then show  $\{a(p). p \in X \times Y\} \subseteq \{b(x,y). \langle x,y \rangle \in X \times Y\}$  by blast
next
  { fix z assume z  $\in \{b(x,y). \langle x,y \rangle \in X \times Y\}$ 
    then obtain x y where D1:  $\langle x,y \rangle \in X \times Y$  z=b(x,y) by auto
    let p =  $\langle x,y \rangle$ 
    from A1 D1 have p $\in X \times Y$  z = a(p) by auto
    then have z  $\in \{a(p). p \in X \times Y\}$  by auto
  } then show  $\{b(x,y). \langle x,y \rangle \in X \times Y\} \subseteq \{a(p). p \in X \times Y\}$  by blast
qed

```

A lemma about inclusion in cartesian products. Included here to remember that we need the $U \times V \neq \emptyset$ assumption.

```

lemma prod_subset: assumes U $\times V \neq \emptyset$  U $\times V \subseteq X \times Y$  shows U $\subseteq X$  and V $\subseteq Y$ 
  using assms by auto

```

A technical lemma about sections in cartesian products.

lemma section_proj: **assumes** $A \subseteq X \times Y$ **and** $U \times V \subseteq A$ **and** $x \in U$ $y \in V$
shows $U \subseteq \{t \in X. \langle t, y \rangle \in A\}$ **and** $V \subseteq \{t \in Y. \langle x, t \rangle \in A\}$
using assms **by** auto

If two meta-functions are the same on a set, then they define the same set by separation.

lemma ZF1_1_L4B: **assumes** $\forall x \in X. a(x) = b(x)$
shows $\{a(x). x \in X\} = \{b(x). x \in X\}$
using assms **by** simp

A set defined by a constant meta-function is a singleton.

lemma ZF1_1_L5: **assumes** $X \neq 0$ **and** $\forall x \in X. b(x) = c$
shows $\{b(x). x \in X\} = \{c\}$ **using** assms **by** blast

Most of the time, auto does this job, but there are strange cases when the next lemma is needed.

lemma subset_with_property: **assumes** $Y = \{x \in X. b(x)\}$
shows $Y \subseteq X$
using assms **by** auto

We can choose an element from a nonempty set.

lemma nonempty_has_element: **assumes** $X \neq 0$ **shows** $\exists x. x \in X$
using assms **by** auto

In Isabelle/ZF the intersection of an empty family is empty. This is exactly lemma Inter_0 from Isabelle's equalities theory. We repeat this lemma here as it is very difficult to find. This is one reason we need comments before every theorem: so that we can search for keywords.

lemma inter_empty_empty: **shows** $\bigcap 0 = 0$ **by** (rule Inter_0)

If an intersection of a collection is not empty, then the collection is not empty. We are (ab)using the fact the the intersection of empty collection is defined to be empty.

lemma inter_nempty_nempty: **assumes** $\bigcap A \neq 0$ **shows** $A \neq 0$
using assms **by** auto

For two collections S, T of sets we define the product collection as the collections of cartesian products $A \times B$, where $A \in S, B \in T$.

definition

$$\text{ProductCollection}(T, S) \equiv \bigcup_{U \in T. \{U \times V. V \in S\}}$$

The union of the product collection of collections S, T is the cartesian product of $\bigcup S$ and $\bigcup T$.

lemma ZF1_1_L6: **shows** $\bigcup \text{ProductCollection}(S, T) = \bigcup S \times \bigcup T$

using ProductCollection_def by auto

An intersection of subsets is a subset.

```
lemma ZF1_1_L7: assumes A1: I≠0 and A2:  $\forall i \in I. P(i) \subseteq X$ 
  shows  $(\bigcap_{i \in I} P(i)) \subseteq X$ 
proof -
  from A1 obtain i0 where i0 ∈ I by auto
  with A2 have  $(\bigcap_{i \in I} P(i)) \subseteq P(i_0)$  and  $P(i_0) \subseteq X$ 
  by auto
  thus  $(\bigcap_{i \in I} P(i)) \subseteq X$  by auto
qed
```

Isabelle/ZF has a "THE" construct that allows to define an element if there is only one such that satisfies given predicate. In pure ZF we can express something similar using the identity proven below.

```
lemma ZF1_1_L8: shows  $\bigcup \{x\} = x$  by auto
```

Some properties of singletons.

```
lemma ZF1_1_L9: assumes A1:  $\exists! x. x \in A \wedge \varphi(x)$ 
  shows
     $\exists a. \{x \in A. \varphi(x)\} = \{a\}$ 
     $\bigcup \{x \in A. \varphi(x)\} \in A$ 
     $\varphi(\bigcup \{x \in A. \varphi(x)\})$ 
proof -
  from A1 show  $\exists a. \{x \in A. \varphi(x)\} = \{a\}$  by auto
  then obtain a where I:  $\{x \in A. \varphi(x)\} = \{a\}$  by auto
  then have  $\bigcup \{x \in A. \varphi(x)\} = a$  by auto
  moreover
  from I have  $a \in \{x \in A. \varphi(x)\}$  by simp
  hence  $a \in A$  and  $\varphi(a)$  by auto
  ultimately show  $\bigcup \{x \in A. \varphi(x)\} \in A$  and  $\varphi(\bigcup \{x \in A. \varphi(x)\})$ 
  by auto
qed
```

A simple version of ZF1_1_L9.

```
corollary singleton_extract: assumes  $\exists! x. x \in A$ 
  shows  $(\bigcup A) \in A$ 
proof -
  from assms have  $\exists! x. x \in A \wedge \text{True}$  by simp
  then have  $\bigcup \{x \in A. \text{True}\} \in A$  by (rule ZF1_1_L9)
  thus  $(\bigcup A) \in A$  by simp
qed
```

A criterion for when a set defined by comprehension is a singleton.

```
lemma singleton_comprehension:
  assumes A1:  $y \in X$  and A2:  $\forall x \in X. \forall y \in X. P(x) = P(y)$ 
  shows  $(\bigcup \{P(x). x \in X\}) = P(y)$ 
proof -
```

```

let A = {P(x). x∈X}
have ∃! c. c ∈ A
proof
  from A1 show ∃c. c ∈ A by auto
next
  fix a b assume a ∈ A and b ∈ A
  then obtain x t where
    x ∈ X a = P(x) and t ∈ X b = P(t)
  by auto
  with A2 show a=b by blast
qed
then have (⋃A) ∈ A by (rule singleton_extract)
then obtain x where x ∈ X and (⋃A) = P(x)
  by auto
from A1 A2 ⟨x ∈ X⟩ have P(x) = P(y)
  by blast
with ⟨(⋃A) = P(x)⟩ show (⋃A) = P(y) by simp
qed

```

Adding an element of a set to that set does not change the set.

```

lemma set_elem_add: assumes x∈X shows X ∪ {x} = X using assms
  by auto

```

Here we define a restriction of a collection of sets to a given set. In romantic math this is typically denoted $X \cap M$ and means $\{X \cap A : A \in M\}$. Note there is also $\text{restrict}(f, A)$ defined for relations in ZF.thy.

definition

```

RestrictedTo (infixl {restricted to} 70) where
M {restricted to} X ≡ {X ∩ A . A ∈ M}

```

A lemma on a union of a restriction of a collection to a set.

```

lemma union_restrict:
  shows ⋃ (M {restricted to} X) = (⋃M) ∩ X
  using RestrictedTo_def by auto

```

Next we show a technical identity that is used to prove sufficiency of some condition for a collection of sets to be a base for a topology.

```

lemma ZF1_1_L10: assumes A1: ∀U∈C. ∃A∈B. U = ⋃A
  shows ⋃⋃ {⋃{A∈B. U = ⋃A}. U∈C} = ⋃C
proof
  show ⋃ (⋃U∈C. ⋃{A ∈ B . U = ⋃A}) ⊆ ⋃C by blast
  show ⋃C ⊆ ⋃ (⋃U∈C. ⋃{A ∈ B . U = ⋃A})
  proof -
    fix x assume x ∈ ⋃C
    show x ∈ ⋃ (⋃U∈C. ⋃{A ∈ B . U = ⋃A})
    proof -
      from ⟨x ∈ ⋃C⟩ obtain U where U∈C ∧ x∈U by auto
      with A1 obtain A where A∈B ∧ U = ⋃A by auto
    end
  end
end

```

```

      from ⟨U ∈ C ∧ x ∈ U⟩ ⟨A ∈ B ∧ U = ⋃ A⟩ show x ∈ ⋃ (⋃ U ∈ C. ⋃ {A ∈ B . U
= ⋃ A})
    by auto
      qed
    qed
  qed

```

Standard Isabelle uses a notion of $\text{cons}(A, a)$ that can be thought of as $A \cup \{a\}$.

```

lemma consdef: shows cons(a, A) = A ∪ {a}
  using cons_def by auto

```

If a difference between a set and a singleton is empty, then the set is empty or it is equal to the singleton.

```

lemma singl_diff_empty: assumes A - {x} = 0
  shows A = 0 ∨ A = {x}
  using assms by auto

```

If a difference between a set and a singleton is the set, then the only element of the singleton is not in the set.

```

lemma singl_diff_eq: assumes A1: A - {x} = A
  shows x ∉ A
proof -
  have x ∉ A - {x} by auto
  with A1 show x ∉ A by simp
qed

```

A basic property of sets defined by comprehension.

```

lemma comprehension: assumes a ∈ {x ∈ X. p(x)}
  shows a ∈ X and p(a) using assms by auto

```

The image of a set by a greater relation is greater.

```

lemma image_rel_mono: assumes r ⊆ s shows r(A) ⊆ s(A)
  using assms by auto

```

A technical lemma about relations: if x is in its image by a relation U and that image is contained in some set C , then the image of the singleton $\{x\}$ by the relation $U \cup C \times C$ equals C .

```

lemma image_greater_rel:
  assumes x ∈ U{x} and U{x} ⊆ C
  shows (U ∪ C × C){x} = C
  using assms image_Un_left by blast

```

Reformulation of the definition of composition of two relations:

```

lemma rel_compdef:
  shows ⟨x, z⟩ ∈ r ∘ s ⟷ (∃ y. ⟨x, y⟩ ∈ s ∧ ⟨y, z⟩ ∈ r)
  unfolding comp_def by auto

```

Domain and range of the relation of the form $\bigcup\{U \times U : U \in P\}$ is $\bigcup P$:

```
lemma domain_range_sym: shows domain( $\bigcup\{U \times U. U \in P\}$ ) =  $\bigcup P$  and range( $\bigcup\{U \times U. U \in P\}$ ) =  $\bigcup P$ 
  by auto
```

An identity for the square (in the sense of composition) of a symmetric relation.

```
lemma symm_sq_prod_image: assumes converse(r) = r
  shows  $r \circ r = \bigcup\{(r\{x\}) \times (r\{x\}). x \in \text{domain}(r)\}$ 
proof
  { fix p assume p  $\in r \circ r$ 
    then obtain y z where  $\langle y, z \rangle = p$  by auto

4 Natural numbers in IsarMathLib

theory `Nat_ZF_IML` **imports** `ZF.Arith`

begin

The ZF set theory constructs natural numbers from the empty set and the notion of a one-element set. Namely, zero of natural numbers is defined as the empty set. For each natural number n the next natural number is defined as $n \cup \{n\}$. With this definition for every non-zero natural number we get the identity $n = \{0, 1, 2, \dots, n-1\}$. It is good to remember that when we see an expression like $f : n \rightarrow X$. Also, with this definition the relation "less or equal than" becomes " \subseteq " and the relation "less than" becomes " \in ".

4.1 Induction

The induction lemmas in the standard Isabelle's `Nat.thy` file like for example `nat_induct` require the induction step to be a higher order statement (the one that uses the \implies sign). I found it difficult to apply from Isar, which is perhaps more of an indication of my Isar skills than anything else. Anyway, here we provide a first order version that is easier to reference in Isar declarative style proofs.

The next theorem is a version of induction on natural numbers that I was thought in school.

theorem `ind_on_nat`:

`assumes A1: $n \in \text{nat}$ and A2: $P(0)$ and A3: $\forall k \in \text{nat}. P(k) \implies P(\text{succ}(k))$`
`shows $P(n)$`

proof -

`note A1 A2`

`moreover`

4.2 Intervals

In this section we consider intervals of natural numbers i.e. sets of the form $\{n + j : j \in 0..k - 1\}$.

The interval is determined by two parameters: starting point and length. Recall that in standard Isabelle's `Arith.thy` the symbol `#+` is defined as the sum of natural numbers.

definition

$$\text{NatInterval}(n, k) \equiv \{n \# + j. j \in k\}$$

Subtracting the beginning of the interval results in a number from the length of the interval. It may sound weird, but note that the length of such interval is a natural number, hence a set.

```

lemma inter_diff_in_len:
  assumes A1:  $k \in \text{nat}$  and A2:  $i \in \text{NatInterval}(n, k)$ 
  shows  $i \# - n \in k$ 
proof -
  from A2 obtain j where I:  $i = n \# + j$  and II:  $j \in k$

    n #+ k #+ m = n ∪ NatInterval(n, k #+ m)
    n #+ k #+ m = n ∪ NatInterval(n, k) ∪ NatInterval(n #+ k, m)
    using assms add_assoc length_start_decomp by auto
end

```

5 Order relations - introduction

`theory Order_ZF imports Fol1`

`begin`

This theory file considers various notion related to order. We redefine the notions of a total order, linear order and partial order to have the same terminology as Wikipedia (I found it very consistent across different areas of math). We also define and study the notions of intervals and bounded sets. We show the inclusion relations between the intervals with endpoints being in certain order. We also show that union of bounded sets are bounded. This allows to show in `Finite_ZF.thy` that finite sets are bounded.

5.1 Definitions

In this section we formulate the definitions related to order relations.

A relation r is "total" on a set X if for all elements a, b of X we have a is in relation with b or b is in relation with a . An example is the \leq relation on numbers.

definition

`IsTotal (infixl {is total on} 65) where`
 `$r \text{ {is total on} } X \equiv (\forall a \in X. \forall b \in X. \langle a, b \rangle \in r \vee \langle b, a \rangle \in r)$`

A relation r is a partial order on X if it is reflexive on X (i.e. $\langle x, x \rangle$ for every $x \in X$), antisymmetric (if $\langle x, y \rangle \in r$ and $\langle y, x \rangle \in r$, then $x = y$) and transitive ($\langle x, y \rangle \in r$ and $\langle y, z \rangle \in r$ implies $\langle x, z \rangle \in r$).

definition

`$\text{IsPartOrder}(X, r) \equiv (\text{refl}(X, r) \wedge \text{antisym}(r) \wedge \text{trans}(r))$`

We define a linear order as a binary relation that is antisymmetric, transitive and total. Note that this terminology is different than the one used the standard `Order.thy` file.

definition

`$\text{IsLinOrder}(X, r) \equiv (\text{antisym}(r) \wedge \text{trans}(r) \wedge (r \text{ {is total on} } X))$`

A set is bounded above if there is that is an upper bound for it, i.e. there are some u such that $\langle x, u \rangle \in r$ for all $x \in A$. In addition, the empty set is defined as bounded.

definition

`$\text{IsBoundedAbove}(A, r) \equiv (A = 0 \vee (\exists u. \forall x \in A. \langle x, u \rangle \in r))$`

We define sets bounded below analogously.

definition

`$\text{IsBoundedBelow}(A, r) \equiv (A = 0 \vee (\exists l. \forall x \in A. \langle l, x \rangle \in r))$`

A set is bounded if it is bounded below and above.

definition

$$\text{IsBounded}(A, r) \equiv (\text{IsBoundedAbove}(A, r) \wedge \text{IsBoundedBelow}(A, r))$$

The notation for the definition of an interval may be mysterious for some readers, see lemma `Order_ZF_2_L1` for more intuitive notation.

definition

$$\text{Interval}(r, a, b) \equiv r\{a\} \cap r-\{b\}$$

We also define the maximum (the greater of) two elements in the obvious way.

definition

$$\text{GreaterOf}(r, a, b) \equiv (\text{if } \langle a, b \rangle \in r \text{ then } b \text{ else } a)$$

The definition of a minimum (the smaller of) two elements.

definition

$$\text{SmallerOf}(r, a, b) \equiv (\text{if } \langle a, b \rangle \in r \text{ then } a \text{ else } b)$$

We say that a set has a maximum if it has an element that is not smaller than any other one. We show that under some conditions this element of the set is unique (if exists).

definition

$$\text{HasAmaximum}(r, A) \equiv \exists M \in A. \forall x \in A. \langle x, M \rangle \in r$$

A similar definition what it means that a set has a minimum.

definition

$$\text{HasAminimum}(r, A) \equiv \exists m \in A. \forall x \in A. \langle m, x \rangle \in r$$

Definition of the maximum of a set.

definition

$$\text{Maximum}(r, A) \equiv \text{THE } M. M \in A \wedge (\forall x \in A. \langle x, M \rangle \in r)$$

Definition of a minimum of a set.

definition

$$\text{Minimum}(r, A) \equiv \text{THE } m. m \in A \wedge (\forall x \in A. \langle m, x \rangle \in r)$$

The supremum of a set A is defined as the minimum of the set of upper bounds, i.e. the set $\{u. \forall a \in A. \langle a, u \rangle \in r\} = \bigcap_{a \in A} r\{a\}$. Recall that in Isabelle/ZF $r-(A)$ denotes the inverse image of the set A by relation r (i.e. $r-(A) = \{x : \langle x, y \rangle \in r \text{ for some } y \in A\}$).

definition

$$\text{Supremum}(r, A) \equiv \text{Minimum}(r, \bigcap_{a \in A} r\{a\})$$

The notion of "having a supremum" is the same as the set of upper bounds having a minimum, but having it as a separate notion does simplify notation in some cases. The definition is written in terms of images of singletons $\{x\}$

under relation. To understand this formulation note that the set of upper bounds of a set $A \subseteq X$ is $\bigcap_{x \in A} \{y \in X \mid \langle x, y \rangle \in r\}$, which is the same as $\bigcap_{x \in A} r(\{x\})$, where $r(\{x\})$ is the image of the singleton $\{x\}$ under relation r .

definition

$$\text{HasAsupremum}(r, A) \equiv \text{HasAminimum}(r, \bigcap_{a \in A} r\{a\})$$

The notion of "having an infimum" is the same as the set of lower bounds having a maximum.

definition

$$\text{HasAnInfimum}(r, A) \equiv \text{HasAmaximum}(r, \bigcap_{a \in A} r^{-}\{a\})$$

Infimum is defined analogously.

definition

$$\text{Infimum}(r, A) \equiv \text{Maximum}(r, \bigcap_{a \in A} r^{-}\{a\})$$

We define a relation to be complete if every nonempty bounded above set has a supremum.

definition

$$\begin{aligned} &\text{IsComplete } (_ \text{ \{is complete\}}) \text{ where} \\ &r \text{ \{is complete\}} \equiv \\ &\forall A. \text{IsBoundedAbove}(A, r) \wedge A \neq \emptyset \longrightarrow \text{HasAminimum}(r, \bigcap_{a \in A} r\{a\}) \end{aligned}$$

The essential condition to show that a total relation is reflexive.

lemma `Order_ZF_1_L1`: assumes r {is total on} X and $a \in X$
 shows $\langle a, a \rangle \in r$ using `assms IsTotal_def` by `auto`

A total relation is reflexive.

lemma `total_is_refl`:
 assumes r {is total on} X
 shows `refl`(X, r) using `assms Order_ZF_1_L1 refl_def` by `simp`

A linear order is partial order.

lemma `Order_ZF_1_L2`: assumes `IsLinOrder`(X, r)
 shows `IsPartOrder`(X, r)
 using `assms IsLinOrder_def IsPartOrder_def refl_def Order_ZF_1_L1`
 by `auto`

Partial order that is total is linear.

lemma `Order_ZF_1_L3`:
 assumes `IsPartOrder`(X, r) and r {is total on} X
 shows `IsLinOrder`(X, r)
 using `assms IsPartOrder_def IsLinOrder_def`
 by `simp`

Relation that is total on a set is total on any subset.

```

lemma Order_ZF_1_L4: assumes r {is total on} X and  $A \subseteq X$ 
  shows r {is total on} A
  using assms IsTotal_def by auto

```

We can restrict a partial order relation to the domain.

```

lemma part_ord_restr: assumes IsPartOrder(X,r)
  shows IsPartOrder(X,r  $\cap$  X $\times$ X)
  using assms unfolding IsPartOrder_def refl_def antisym_def trans_def
  by auto

```

We can restrict a total order relation to the domain.

```

lemma total_ord_restr: assumes r {is total on} X
  shows (r  $\cap$  X $\times$ X) {is total on} X
  using assms unfolding IsTotal_def by auto

```

A linear relation is linear on any subset and we can restrict it to any subset.

```

lemma ord_linear_subset: assumes IsLinOrder(X,r) and  $A \subseteq X$ 
  shows IsLinOrder(A,r) and IsLinOrder(A,r  $\cap$  A $\times$ A)

```

If the relation is total, then every set is a union of those elements that are nongreater than a given one and nonsmaller than a given one.

```

lemma Order_ZF_1_L5:
  assumes r {is total on} X and  $A \subseteq X$  and  $a \in X$ 
  shows  $A = \{x \in A. \langle x, a \rangle \in r\} \cup \{x \in A. \langle a, x \rangle \in r\}$ 
  using assms IsTotal_def by auto

```

A technical fact about reflexive relations.

```

lemma refl_add_point:
  assumes refl(X,r) and  $A \subseteq B \cup \{x\}$  and  $B \subseteq X$  and
   $x \in X$  and  $\forall y \in B. \langle y, x \rangle \in r$ 
  shows  $\forall a \in A. \langle a, x \rangle \in r$ 
  using assms refl_def by auto

```

5.2 Intervals

In this section we discuss intervals.

The next lemma explains the notation of the definition of an interval.

```

lemma Order_ZF_2_L1:

```

```

shows  $x \in \text{Interval}(r, a, b) \iff \langle a, x \rangle \in r \wedge \langle x, b \rangle \in r$ 
using Interval_def by auto

```

Since there are some problems with applying the above lemma (seems that simp and auto don't handle equivalence very well), we split Order_ZF_2_L1 into two lemmas.

```

lemma Order_ZF_2_L1A: assumes  $x \in \text{Interval}(r, a, b)$ 
  shows  $\langle a, x \rangle \in r \wedge \langle x, b \rangle \in r$ 
  using assms Order_ZF_2_L1 by auto

```

Order_ZF_2_L1, implication from right to left.

```

lemma Order_ZF_2_L1B: assumes  $\langle a, x \rangle \in r \wedge \langle x, b \rangle \in r$ 
  shows  $x \in \text{Interval}(r, a, b)$ 
  using assms Order_ZF_2_L1 by simp

```

If the relation is reflexive, the endpoints belong to the interval.

```

lemma Order_ZF_2_L2: assumes refl(X, r)
  and  $a \in X \wedge b \in X$  and  $\langle a, b \rangle \in r$ 
  shows
     $a \in \text{Interval}(r, a, b)$ 
     $b \in \text{Interval}(r, a, b)$ 
  using assms refl_def Order_ZF_2_L1 by auto

```

Under the assumptions of Order_ZF_2_L2, the interval is nonempty.

```

lemma Order_ZF_2_L2A: assumes refl(X, r)
  and  $a \in X \wedge b \in X$  and  $\langle a, b \rangle \in r$ 
  shows  $\text{Interval}(r, a, b) \neq \emptyset$ 
proof -
  from assms have  $a \in \text{Interval}(r, a, b)$

6 More on order relations

```

theory Order_ZF_1 imports ZF.Order ZF1

```

```

begin

```

In `Order_ZF` we define some notions related to order relations based on the nonstrict orders (\leq type). Some people however prefer to talk about these

notions in terms of the strict order relation ($<$ type). This is the case for the standard Isabelle `Order.thy` and also for Metamath. In this theory file we repeat some developments from `Order_ZF` using the strict order relation as a basis. This is mostly useful for Metamath translation, but is also of some general interest. The names of theorems are copied from Metamath.

6.1 Definitions and basic properties

In this section we introduce some definitions taken from Metamath and relate them to the ones used by the standard Isabelle `Order.thy`.

The next definition is the strict version of the linear order. What we write as `R Orders A` is written *ROrdA* in Metamath.

definition

StrictOrder (infix Orders 65) where

$$\begin{aligned} R \text{ Orders } A &\equiv \forall x \ y \ z. (x \in A \wedge y \in A \wedge z \in A) \longrightarrow \\ &(\langle x, y \rangle \in R \longleftrightarrow \neg(x=y \vee \langle y, x \rangle \in R)) \wedge \\ &(\langle x, y \rangle \in R \wedge \langle y, z \rangle \in R \longrightarrow \langle x, z \rangle \in R) \end{aligned}$$

The definition of supremum for a (strict) linear order.

definition

$$\begin{aligned} \text{Sup}(B, A, R) &\equiv \\ &\bigcup \{x \in A. (\forall y \in B. \langle x, y \rangle \notin R) \wedge \\ &(\forall y \in A. \langle y, x \rangle \in R \longrightarrow (\exists z \in B. \langle y, z \rangle \in R))\} \end{aligned}$$

Definition of infimum for a linear order. It is defined in terms of supremum.

definition

$$\text{Infim}(B, A, R) \equiv \text{Sup}(B, A, \text{converse}(R))$$

If relation R orders a set A , (in Metamath sense) then R is irreflexive, transitive and linear therefore is a total order on A (in Isabelle sense).

lemma orders_imp_tot_ord: assumes A1: $R \text{ Orders } A$

shows

$\text{irrefl}(A, R)$
 $\text{trans}[A](R)$
 $\text{part_ord}(A, R)$
 $\text{linear}(A, R)$
 $\text{tot_ord}(A, R)$

6.2 Properties of (strict) total orders

In this section we discuss the properties of strict order relations. This continues the development contained in the standard Isabelle's `Order.thy` with a view towards using the theorems translated from Metamath.

A relation orders a set iff the converse relation orders a set. Going one way we can use the lemma `tot_od_converse` from the standard Isabelle's `Order.thy`. The other way is a bit more complicated (note that in Isabelle for `converse(converse(r)) = r` one needs r to consist of ordered pairs, which does not follow from the `StrictOrder` definition above).

```

lemma cnvso: shows R Orders A ⟷ converse(R) Orders A
proof
  let r = converse(R)

7 Even more on order relations

```

theory Order_ZF_1a imports Order_ZF

```

```

begin

```

This theory is a continuation of `Order_ZF` and talks about maximums and minimum of a set, supremum and infimum and strict (not reflexive) versions of order relations.

7.1 Maximum and minimum of a set

In this section we show that maximum and minimum are unique if they exist. We also show that union of sets that have maxima (minima) has a maximum (minimum). We also show that singletons have maximum and minimum. All this allows to show (in `Finite_ZF`) that every finite set has well-defined maximum and minimum.

A somewhat technical fact that allows to reduce the number of premises in some theorems: the assumption that a set has a maximum implies that it is not empty.

```
lemma set_max_not_empty: assumes HasAmaximum(r,A) shows A≠0
using assms unfolding HasAmaximum_def by auto
```

If a set has a maximum implies that it is not empty.

```
lemma set_min_not_empty: assumes HasAminimum(r,A) shows A≠0
using assms unfolding HasAminimum_def by auto
```

If a set has a supremum then it cannot be empty. We are probably using the fact that $\bigcap \emptyset = \emptyset$, which makes me a bit anxious as this I think is just a convention.

```
lemma set_sup_not_empty: assumes HasAsupremum(r,A) shows A≠0
proof -
  from assms have HasAminimum(r,  $\bigcap a \in A. r\{a\}$ ) unfolding HasAsupremum_def
    by simp
  then have ( $\bigcap a \in A. r\{a\}$ )  $\neq 0$  using set_min_not_empty by simp
  then obtain x where x  $\in$  ( $\bigcap y \in A. r\{y\}$ ) by blast
  thus thesis by auto
qed
```

If a set has an infimum then it cannot be empty.

```
lemma set_inf_not_empty: assumes HasAnInfimum(r,A) shows A≠0
proof -
  from assms have HasAmaximum(r,  $\bigcap a \in A. r-\{a\}$ ) unfolding HasAnInfimum_def
    by simp
  then have ( $\bigcap a \in A. r-\{a\}$ )  $\neq 0$  using set_max_not_empty by simp
  then obtain x where x  $\in$  ( $\bigcap y \in A. r-\{y\}$ ) by blast
  thus thesis by auto
qed
```

For antisymmetric relations maximum of a set is unique if it exists.

```
lemma Order_ZF_4_L1: assumes A1: antisym(r) and A2: HasAmaximum(r,A)
```

```

    shows  $\exists!M. M \in A \wedge (\forall x \in A. \langle x, M \rangle \in r)$

7.2 Supremum and Infimum

In this section we consider the notions of supremum and infimum a set.

Elements of the set of upper bounds are indeed upper bounds. Isabelle also thinks it is obvious.

```

lemma Order_ZF_5_L1: assumes  $u \in (\bigcap a \in A. r\{a\})$  and  $a \in A$ 
  shows  $\langle a, u \rangle \in r$ 
  using assms by auto

```

Elements of the set of lower bounds are indeed lower bounds. Isabelle also thinks it is obvious.

```

lemma Order_ZF_5_L2: assumes  $l \in (\bigcap a \in A. r-\{a\})$  and  $a \in A$ 
  shows  $\langle l, a \rangle \in r$ 
  using assms by auto

```

If the set of upper bounds has a minimum, then the supremum is less or equal than any upper bound. We can probably do away with the assumption that A is not empty, (ab)using the fact that intersection over an empty family is defined in Isabelle to be empty. This lemma is obsolete and will be removed in the future. Use `sup_leq_up_bnd` instead.

```
lemma Order_ZF_5_L3: assumes A1: antisym(r) and A2: A≠0 and
  A3: HasAminimum(r, ⋂ a∈A. r{a}) and
  A4: ∀ a∈A. ⟨a,u⟩ ∈ r
  shows ⟨Supremum(r,A),u⟩ ∈ r
proof -
  let U = ⋂ a∈A. r{a}
  from A4 have ∀ a∈A. u ∈ r{a} using image_singleton_iff

7.3 Strict versions of order relations

One of the problems with translating formalized mathematics from Metamath to IsarMathLib is that Metamath uses strict orders (of the $<$ type) while in IsarMathLib we mostly use nonstrict orders (of the \leq type). This doesn't really make any difference, but is annoying as we have to prove many theorems twice. In this section we prove some theorems to make it easier to translate the statements about strict orders to statements about the corresponding non-strict order and vice versa.

We define a strict version of a relation by removing the $y = x$ line from the relation.

definition

$\text{StrictVersion}(r) \equiv r - \{\langle x, x \rangle. x \in \text{domain}(r)\}$

A reformulation of the definition of a strict version of an order.

lemma `def_of_strict_ver`: **shows**

$\langle x, y \rangle \in \text{StrictVersion}(r) \longleftrightarrow \langle x, y \rangle \in r \wedge x \neq y$
using `StrictVersion_def` `domain_def` **by** `auto`

The next lemma is about the strict version of an antisymmetric relation.

lemma `strict_of_antisym`:

assumes `A1: antisym(r)` **and** `A2: $\langle a, b \rangle \in \text{StrictVersion}(r)$`
shows $\langle b, a \rangle \notin \text{StrictVersion}(r)$

proof -

{ **assume** `A3: $\langle b, a \rangle \in \text{StrictVersion}(r)$`
with `A2` **have** $\langle a, b \rangle \in r$ **and** $\langle b, a \rangle \in r$
using `def_of_strict_ver` **by** `auto`
with `A1` **have** $a = b$ **by** `(rule Foll_L4)`
with `A2` **have** `False` **using** `def_of_strict_ver`
by `simp`
} **then show** $\langle b, a \rangle \notin \text{StrictVersion}(r)$ **by** `auto`

qed

The strict version of totality.

lemma `strict_of_tot`:

assumes `r {is total on} X` **and** $a \in X$ $b \in X$ $a \neq b$
shows $\langle a, b \rangle \in \text{StrictVersion}(r) \vee \langle b, a \rangle \in \text{StrictVersion}(r)$
using `assms` `IsTotal_def` `def_of_strict_ver` **by** `auto`

A trichotomy law for the strict version of a total and antisymmetric relation.

It is kind of interesting that one does not need the full linear order for this.

lemma `strict_ans_tot_trich`:

assumes `A1: antisym(r)` **and** `A2: r {is total on} X`
and `A3: $a \in X$ $b \in X$`
and `A4: $s = \text{StrictVersion}(r)$`
shows `Exactly_1_of_3_holds($\langle a, b \rangle \in s$, $a = b$, $\langle b, a \rangle \in s$)`

```

proof -
  let p =  $\langle a, b \rangle \in s$ 
  let q =  $a=b$ 
  let r =  $\langle b, a \rangle \in s$ 
  from A2 A3 A4 have  $p \vee q \vee r$ 
    using strict_of_tot by auto
  moreover from A1 A4 have  $p \longrightarrow \neg q \wedge \neg r$ 
    using def_of_strict_ver strict_of_antisym by simp
  moreover from A4 have  $q \longrightarrow \neg p \wedge \neg r$ 
    using def_of_strict_ver by simp
  moreover from A1 A4 have  $r \longrightarrow \neg p \wedge \neg q$ 
    using def_of_strict_ver strict_of_antisym by auto
  ultimately show Exactly_1_of_3_holds(p, q, r)
    by (rule Fol1_L5)
qed

```

A trichotomy law for linear order. This is a special case of `strict_ans_tot_trich`.

```

corollary strict_lin_trich: assumes A1: IsLinOrder(X,r) and
  A2:  $a \in X$   $b \in X$  and
  A3:  $s = \text{StrictVersion}(r)$ 
  shows Exactly_1_of_3_holds( $\langle a, b \rangle \in s$ ,  $a=b$ ,  $\langle b, a \rangle \in s$ )
  using assms IsLinOrder_def strict_ans_tot_trich by auto

```

For an antisymmetric relation if a pair is in relation then the reversed pair is not in the strict version of the relation.

```

lemma geq_impl_not_less:
  assumes A1: antisym(r) and A2:  $\langle a, b \rangle \in r$ 
  shows  $\langle b, a \rangle \notin \text{StrictVersion}(r)$ 
proof -
  { assume A3:  $\langle b, a \rangle \in \text{StrictVersion}(r)$ 
    with A2 have  $\langle a, b \rangle \in \text{StrictVersion}(r)$ 
      using def_of_strict_ver by auto
    with A1 A3 have False using strict_of_antisym
      by blast
  } then show  $\langle b, a \rangle \notin \text{StrictVersion}(r)$  by auto
qed

```

If an antisymmetric relation is transitive, then the strict version is also transitive, an explicit version `strict_of_transB` below.

```

lemma strict_of_transA:
  assumes A1: trans(r) and A2: antisym(r) and
  A3:  $s = \text{StrictVersion}(r)$  and A4:  $\langle a, b \rangle \in s$   $\langle b, c \rangle \in s$ 
  shows  $\langle a, c \rangle \in s$ 
proof -
  from A3 A4 have I:  $\langle a, b \rangle \in r \wedge \langle b, c \rangle \in r$ 
    using def_of_strict_ver by simp
  with A1 have  $\langle a, c \rangle \in r$  by (rule Fol1_L3)
  moreover

```

```

{ assume a=c
  with I have ⟨a,b⟩ ∈ r and ⟨b,a⟩ ∈ r by auto
  with A2 have a=b by (rule Fol1_L4)
  with A3 A4 have False using def_of_strict_ver by simp
} then have a≠c by auto
ultimately have ⟨a,c⟩ ∈ StrictVersion(r)
  using def_of_strict_ver by simp
with A3 show thesis by simp
qed

```

If an antisymmetric relation is transitive, then the strict version is also transitive.

```

lemma strict_of_transB:
  assumes A1: trans(r) and A2: antisym(r)
  shows trans(StrictVersion(r))
proof -
  let s = StrictVersion(r)
  from A1 A2 have
    ∀ x y z. ⟨x, y⟩ ∈ s ∧ ⟨y, z⟩ ∈ s ⟶ ⟨x, z⟩ ∈ s
    using strict_of_transA by blast
  then show trans(StrictVersion(r)) by (rule Fol1_L2)
qed

```

The next lemma provides a condition that is satisfied by the strict version of a relation if the original relation is a complete linear order.

```

lemma strict_of_compl:
  assumes A1: r ⊆ X×X and A2: IsLinOrder(X,r) and
  A3: r {is complete} and
  A4: A⊆X A≠0 and A5: s = StrictVersion(r) and
  A6: ∃u∈X. ∀y∈A. ⟨y,u⟩ ∈ s
  shows
  ∃x∈X. ( ∀y∈A. ⟨x,y⟩ ∉ s ) ∧ (∀y∈X. ⟨y,x⟩ ∈ s ⟶ (∃z∈A. ⟨y,z⟩ ∈ s))
proof -
  let x = Supremum(r,A)
  from A2 have I: antisym(r) using IsLinOrder_def
    by simp
  moreover from A5 A6 have ∃u∈X. ∀y∈A. ⟨y,u⟩ ∈ r

  using assms StrictVersion_def by auto

end

```

8 Functions - introduction

```

theory func1 imports ZF.func Fol1 ZF1

```

```

begin

```

This theory covers basic properties of function spaces. A set of functions with domain X and values in the set Y is denoted in Isabelle as $X \rightarrow Y$. It just happens that the colon ":" is a synonym of the set membership symbol \in in Isabelle/ZF so we can write $f : X \rightarrow Y$ instead of $f \in X \rightarrow Y$. This is the only case that we use the colon instead of the regular set membership symbol.

8.1 Properties of functions, function spaces and (inverse) images.

Functions in ZF are sets of pairs. This means that if $f : X \rightarrow Y$ then $f \subseteq X \times Y$. This section is mostly about consequences of this understanding of the notion of function.

We define the notion of function that preserves a collection here. Given two collection of sets a function preserves the collections if the inverse image of sets in one collection belongs to the second one. This notion does not have a name in romantic math. It is used to define continuous functions in Topology_ZF_2 theory. We define it here so that we can use it for other purposes, like defining measurable functions. Recall that $f^{-1}(A)$ means the inverse image of the set A .

definition

```

PresColl( $f, S, T$ )  $\equiv \forall A \in T. f^{-1}(A) \in S$ 

```

A definition that allows to get the first factor of the domain of a binary function $f : X \times Y \rightarrow Z$.

definition

```

fstdom( $f$ )  $\equiv \text{domain}(\text{domain}(f))$ 

```

If a function maps A into another set, then A is the domain of the function.

```
lemma func1_1_L1: assumes f:A→C shows domain(f) = A
  using assms domain_of_fun by simp
```

Standard Isabelle defines a `function(f)` predicate. The next lemma shows that our functions satisfy that predicate. It is a special version of Isabelle's `fun_is_function`.

```
lemma fun_is_fun: assumes f:X→Y shows function(f)
  using assms fun_is_function by simp
```

A lemma explains what `fstdom` is for.

```
lemma fstdomdef: assumes A1: f: X×Y → Z and A2: Y≠0
  shows fstdom(f) = X

8.2 Functions restricted to a set

Standard Isabelle/ZF defines the notion `restrict(f,A)` of to mean a function (or relation) f restricted to a set. This means that if f is a function defined on X and A is a subset of X then `restrict(f,A)` is a function with the same values as f , but whose domain is A .

What is the inverse image of a set under a restricted function?

```

lemma func1_2_L1: assumes A1: f:X→Y and A2: B⊆X
  shows restrict(f,B)-(A) = f-(A) ∩ B
proof -
  let g = restrict(f,B)
  from A1 A2 have g:B→Y
    using restrict_type2 by simp
  with A2 A1 show g-(A) = f-(A) ∩ B
    using func1_1_L15 restrict_if by auto

8.3 Constant functions

Constant functions are trivial, but still we need to prove some properties to shorten proofs.

We define constant($= c$) functions on a set X in a natural way as $\text{ConstantFunction}(X, c)$.

definition

$\text{ConstantFunction}(X, c) \equiv X \times \{c\}$

Constant function belongs to the function space.

lemma func1_3_L1:

assumes A1: $c \in Y$ shows $\text{ConstantFunction}(X, c) : X \rightarrow Y$

proof -

from A1 have $X \times \{c\} = \{\langle x, y \rangle \in X \times Y. c = y\}$

by auto

with A1 show thesis using func1_1_L11A ConstantFunction_def

by simp

qed

Constant function is equal to the constant on its domain.

lemma func1_3_L2: assumes A1: $x \in X$

shows $\text{ConstantFunction}(X, c)(x) = c$

proof -

have $\text{ConstantFunction}(X, c) \in X \rightarrow \{c\}$

using func1_3_L1 by simp

moreover from A1 have $\langle x, c \rangle \in \text{ConstantFunction}(X, c)$

using ConstantFunction_def by simp

ultimately show thesis using apply_iff by simp

8.5 Functions of two variables

In this section we consider functions whose domain is a cartesian product of two sets. Such functions are called functions of two variables (although really in ZF all functions admit only one argument). For every function of two variables we can define families of functions of one variable by fixing the other variable. This section establishes basic definitions and results for this concept.

We can create functions of two variables by combining functions of one variable.

```

lemma cart_prod_fun: assumes  $f_1: X_1 \rightarrow Y_1$   $f_2: X_2 \rightarrow Y_2$  and
   $g = \{\langle p, \langle f_1(\text{fst}(p)), f_2(\text{snd}(p)) \rangle \rangle. p \in X_1 \times X_2\}$ 
  shows  $g: X_1 \times X_2 \rightarrow Y_1 \times Y_2$  using assms apply_funtype ZF_fun_from_total
  by simp

    using ZF_fun_from_tot_val func1_1_L15 by auto
qed

```

For a function of two variables defined on $X \times Y$, if we fix an $x \in X$ we obtain a function on Y . Note that if `domain(f)` is $X \times Y$, `range(domain(f))` extracts Y from $X \times Y$.

definition

`Fix1stVar(f,x) ≡ {⟨y,f⟨x,y⟩⟩. y ∈ range(domain(f))}`

For every $y \in Y$ we can fix the second variable in a binary function $f : X \times Y \rightarrow Z$ to get a function on X .

definition

$$\text{Fix2ndVar}(f, y) \equiv \{\langle x, f\langle x, y \rangle \rangle. x \in \text{domain}(\text{domain}(f))\}$$

We defined Fix1stVar and Fix2ndVar so that the domain of the function is not listed in the arguments, but is recovered from the function. The next lemma is a technical fact that makes it easier to use this definition.

lemma `fix_var_fun_domain`: **assumes** $A1: f : X \times Y \rightarrow Z$

shows

$$x \in X \longrightarrow \text{Fix1stVar}(f, x) = \{\langle y, f\langle x, y \rangle \rangle. y \in Y\}$$

$$y \in Y \longrightarrow \text{Fix2ndVar}(f, y) = \{\langle x, f\langle x, y \rangle \rangle. x \in X\}$$

proof -

from $A1$ **have** $I: \text{domain}(f) = X \times Y$ **using** `func1_1_L1` **by** `simp`

{ **assume** $x \in X$

with I **have** $\text{range}(\text{domain}(f)) = Y$ **by** `auto`

then have $\text{Fix1stVar}(f, x) = \{\langle y, f\langle x, y \rangle \rangle. y \in Y\}$

using `Fix1stVar_def` **by** `simp`

} **then show** $x \in X \longrightarrow \text{Fix1stVar}(f, x) = \{\langle y, f\langle x, y \rangle \rangle. y \in Y\}$

by `simp`

{ **assume** $y \in Y$

with I **have** $\text{domain}(\text{domain}(f)) = X$ **by** `auto`

then have $\text{Fix2ndVar}(f, y) = \{\langle x, f\langle x, y \rangle \rangle. x \in X\}$

using `Fix2ndVar_def` **by** `simp`

} **then show** $y \in Y \longrightarrow \text{Fix2ndVar}(f, y) = \{\langle x, f\langle x, y \rangle \rangle. x \in X\}$

by `simp`

qed

If we fix the first variable, we get a function of the second variable.

lemma `fix_1st_var_fun`: **assumes** $A1: f : X \times Y \rightarrow Z$ **and** $A2: x \in X$

shows $\text{Fix1stVar}(f, x) : Y \rightarrow Z$

proof -

from $A1$ $A2$ **have** $\forall y \in Y. f\langle x, y \rangle \in Z$

using `apply_funtype` **by** `simp`

then have $\{\langle y, f\langle x, y \rangle \rangle. y \in Y\} : Y \rightarrow Z$ **using** `ZF_fun_from_total` **by** `simp`

with $A1$ $A2$ **show** $\text{Fix1stVar}(f, x) : Y \rightarrow Z$ **using** `fix_var_fun_domain` **by**

`simp`

qed

If we fix the second variable, we get a function of the first variable.

lemma `fix_2nd_var_fun`: **assumes** $A1: f : X \times Y \rightarrow Z$ **and** $A2: y \in Y$

shows $\text{Fix2ndVar}(f, y) : X \rightarrow Z$

proof -

from $A1$ $A2$ **have** $\forall x \in X. f\langle x, y \rangle \in Z$

using `apply_funtype` **by** `simp`

then have $\{\langle x, f\langle x, y \rangle \rangle. x \in X\} : X \rightarrow Z$

using `ZF_fun_from_total` **by** `simp`

with $A1$ $A2$ **show** $\text{Fix2ndVar}(f, y) : X \rightarrow Z$

using fix_var_fun_domain by simp

9 Semilattices and Lattices

```

theory Lattice_ZF imports Order_ZF_1a func1

```

```

begin

```

Lattices can be introduced in algebraic way as commutative idempotent $(x \cdot x = x)$ semigroups or as partial orders with some additional properties. These two approaches are equivalent. In this theory we will use the order-theoretic approach.

9.1 Semilattices

We start with a relation r which is a partial order on a set L . Such situation is defined in `Order_ZF` as the predicate `IsPartOrder(L,r)`.

A partially ordered (L, r) set is a join-semilattice if each two-element subset of L has a supremum (i.e. the least upper bound).

definition

`IsJoinSemilattice(L,r) ≡`
`r ⊆ L × L ∧ IsPartOrder(L,r) ∧ (∀ x ∈ L. ∀ y ∈ L. HasASupremum(r, {x,y}))`

A partially ordered (L, r) set is a meet-semilattice if each two-element subset of L has an infimum (i.e. the greatest lower bound).

definition

`IsMeetSemilattice(L,r) ≡`
`r ⊆ L × L ∧ IsPartOrder(L,r) ∧ (∀ x ∈ L. ∀ y ∈ L. HasAnInfimum(r, {x,y}))`

A partially ordered (L, r) set is a lattice if it is both join and meet-semilattice, i.e. if every two element set has a supremum (least upper bound) and infimum (greatest lower bound).

definition

`IsAlattice (infixl {is a lattice on} 90) where`
`r {is a lattice on} L ≡ IsJoinSemilattice(L,r) ∧ IsMeetSemilattice(L,r)`

Join is a binary operation whose value on a pair $\langle x, y \rangle$ is defined as the supremum of the set $\{x, y\}$.

definition

`Join(L,r) ≡ {⟨p, Supremum(r, {fst(p), snd(p)})⟩ . p ∈ L × L}`

Meet is a binary operation whose value on a pair $\langle x, y \rangle$ is defined as the infimum of the set $\{x, y\}$.

definition

`Meet(L,r) ≡ {⟨p, Infimum(r, {fst(p), snd(p)})⟩ . p ∈ L × L}`

Linear order is a lattice.

lemma `lin_is_latt: assumes r ⊆ L × L and IsLinOrder(L,r)`

`shows r {is a lattice on} L`

proof -

`from assms(2) have IsPartOrder(L,r) using Order_ZF_1_L2 by simp`

`with assms have IsMeetSemilattice(L,r) unfolding IsLinOrder_def IsMeetSemilattice_def`
`using inf_sup_two_el(1) by auto`

`moreover from assms ⟨IsPartOrder(L,r)⟩ have IsJoinSemilattice(L,r)`

`unfolding IsLinOrder_def IsJoinSemilattice_def using inf_sup_two_el(3)`

`by auto`

`ultimately show thesis unfolding IsAlattice_def by simp`

`qed`

In a join-semilattice join is indeed a binary operation.

```

lemma join_is_binop: assumes IsJoinSemilattice(L,r)
  shows Join(L,r) : L×L → L

11 Binary operations

```
theory func_ZF imports func1
```

```
begin
```

In this theory we consider properties of functions that are binary operations, that is they map $X \times X$ into X .

11.1 Lifting operations to a function space

It happens quite often that we have a binary operation on some set and we need a similar operation that is defined for functions on that set. For example once we know how to add real numbers we also know how to add real-valued functions: for $f, g : X \rightarrow \mathbf{R}$ we define $(f + g)(x) = f(x) + g(x)$. Note that formally the $+$ means something different on the left hand side of this equality than on the right hand side. This section aims at formalizing this process. We will call it "lifting to a function space", if you have a suggestion for a better name, please let me know.

Since we are writing in generic set notation, the definition below is a bit complicated. Here it what it says: Given a set X and another set f (that represents a binary function on X) we are defining f lifted to function space over X as the binary function (a set of pairs) on the space $F = X \rightarrow \text{range}(f)$ such that the value of this function on pair $\langle a, b \rangle$ of functions on X is another function c on X with values defined by $c(x) = f\langle a(x), b(x) \rangle$.

definition

Lift2FcnSpce (**infix** {lifted to function space over} 65) **where**
 f {lifted to function space over} $X \equiv$
 $\{\langle p, \langle x, f(\text{fst}(p)(x), \text{snd}(p)(x)) \rangle \rangle. x \in X\}$.
 $p \in (X \rightarrow \text{range}(f)) \times (X \rightarrow \text{range}(f))\}$

The result of the lift belongs to the function space.

lemma func_ZF_1_L1:

11.2 Associative and commutative operations

In this section we define associative and commutative operations and prove that they remain such when we lift them to a function space.

Typically we say that a binary operation “ \cdot ” on a set G is “associative” if $(x \cdot y) \cdot z = x \cdot (y \cdot z)$ for all $x, y, z \in G$. Our actual definition below does not use the multiplicative notation so that we can apply it equally to the additive notation $+$ or whatever infix symbol we may want to use. Instead,

we use the generic set theory notation and write $P\langle x, y \rangle$ to denote the value of the operation P on a pair $\langle x, y \rangle \in G \times G$.

definition

IsAssociative (infix {is associative on} 65) where
 $P \{is\ associative\ on\} G \equiv P : G \times G \rightarrow G \wedge$
 $(\forall x \in G. \forall y \in G. \forall z \in G.$
 $(P(\langle P(\langle x, y \rangle), z \rangle) = P(\langle x, P(\langle y, z \rangle) \rangle)))$

A binary function $f : X \times X \rightarrow Y$ is commutative if $f\langle x, y \rangle = f\langle y, x \rangle$. Note that in the definition of associativity above we talk about binary "operation" and here we say use the term binary "function". This is not set in stone, but usually the word "operation" is used when the range is a factor of the domain, while the word "function" allows the range to be a completely unrelated set.

definition

IsCommutative (infix {is commutative on} 65) where
 $f \{is\ commutative\ on\} G \equiv \forall x \in G. \forall y \in G. f\langle x, y \rangle = f\langle y, x \rangle$

The lift of a commutative function is commutative.

lemma func_ZF_2_L1:

assumes A1: $f : G \times G \rightarrow G$
and A2: $F = f \{lifted\ to\ function\ space\ over\} X$
and A3: $s : X \rightarrow range(f)$ $r : X \rightarrow range(f)$
and A4: $f \{is\ commutative\ on\} G$
shows $F\langle s, r \rangle = F\langle r, s \rangle$

  using assms IsOpClosed_def by simp

```

11.4 Compositions

For any set X we can consider a binary operation on the set of functions $f : X \rightarrow X$ defined by $C(f, g) = f \circ g$. Composition of functions (or relations) is defined in the standard Isabelle distribution as a higher order function and denoted with the letter \circ . In this section we consider the corresponding two-argument ZF-function (binary operation), that is a subset of $((X \rightarrow X) \times (X \rightarrow X)) \times (X \rightarrow X)$.

We define the notion of composition on the set X as the binary operation on the function space $X \rightarrow X$ that takes two functions and creates the their composition.

```

definition
  Composition(X) ≡
    {⟨p, fst(p) ∘ snd(p)⟩. p ∈ (X→X) × (X→X)}

```

Composition operation is a function that maps $(X \rightarrow X) \times (X \rightarrow X)$ into $X \rightarrow X$.

```

11.5 Identity function

In this section we show some additional facts about the identity function defined in the standard Isabelle's Perm theory. Note there is also `image_id_same` lemma in `func1` theory.

A function that maps every point to itself is the identity on its domain.

```
lemma identity_fun: assumes A1: f:X→Y and A2:∀x∈X. f(x)=x
  shows f = id(X)
proof -
  from assms have f:X→Y and id(X):X→X and ∀x∈X. f(x) = id(X)(x)
    using id_type id_conv by auto
  then show thesis by (rule func_eq)
qed
```

Composing a function with identity does not change the function.

```
lemma func_ZF_6_L1A: assumes A1: f : X→X
  shows Composition(X)⟨f,id(X)⟩ = f
  Composition(X)⟨id(X),f⟩ = f
proof -
  have Composition(X) : (X→X)×(X→X)→(X→X)
    using func_ZF_5_L1 by simp
  with A1 have Composition(X)⟨id(X),f⟩ : X→X
    Composition(X)⟨f,id(X)⟩ : X→X
    using id_type apply_funtype by auto
  moreover note A1
  moreover from A1 have
    ∀x∈X. (Composition(X)⟨id(X),f⟩)(x) = f(x)
    ∀x∈X. (Composition(X)⟨f,id(X)⟩)(x) = f(x)
    using id_type func_ZF_5_L3 apply_funtype id_conv
    by auto
  ultimately show Composition(X)⟨id(X),f⟩ = f
    Composition(X)⟨f,id(X)⟩ = f
    using fun_extension_iff by auto
qed
```

An intuitively clear, but surprisingly nontrivial fact: identity is the only function from a singleton to itself.

```
lemma singleton_fun_id: shows ({x} → {x}) = {id({x})}
proof
  show {id({x})} ⊆ ({x} → {x})
    using id_def by simp
  { let g = id({x})
    fix f assume f : {x} → {x}
    then have f : {x} → {x} and g : {x} → {x}
      using id_def by auto
    moreover from ⟨f : {x} → {x}⟩ have ∀x ∈ {x}. f(x) = g(x)
      using apply_funtype id_def by auto
```

```

      ultimately have f = g by (rule func_eq)
    } then show  $\{\{x\} \rightarrow \{x\}\} \subseteq \{\text{id}(\{x\})\}$  by auto
qed

```

Another trivial fact: identity is the only bijection of a singleton with itself.

```

lemma single_bij_id: shows  $\text{bij}(\{x\}, \{x\}) = \{\text{id}(\{x\})\}$ 
proof
  show  $\{\text{id}(\{x\})\} \subseteq \text{bij}(\{x\}, \{x\})$  using id_bij
  by simp
  { fix f assume f  $\in \text{bij}(\{x\}, \{x\})$ 
    then have f :  $\{x\} \rightarrow \{x\}$  using bij_is_fun
    by simp
    then have f  $\in \{\text{id}(\{x\})\}$  using singleton_fun_id
    by simp
  } then show  $\text{bij}(\{x\}, \{x\}) \subseteq \{\text{id}(\{x\})\}$  by auto
qed

```

A kind of induction for the identity: if a function f is the identity on a set with a fixpoint of f removed, then it is the identity on the whole set.

```

lemma id_fixpoint_rem: assumes A1:  $f:X \rightarrow X$  and
  A2:  $p \in X$  and A3:  $f(p) = p$  and
  A4:  $\text{restrict}(f, X - \{p\}) = \text{id}(X - \{p\})$ 
  shows  $f = \text{id}(X)$ 
proof -
  from A1 have f:  $X \rightarrow X$  and id(X) :  $X \rightarrow X$ 
  using id_def by auto
  moreover
  { fix x assume  $x \in X$ 
    { assume  $x \in X - \{p\}$ 
      then have  $f(x) = \text{restrict}(f, X - \{p\})(x)$ 
    }
  }
  using restrict by simp
  with A4  $\langle x \in X - \{p\} \rangle$  have  $f(x) = x$ 
  using id_def by simp }
  with A2 A3  $\langle x \in X \rangle$  have  $f(x) = x$  by auto
  } then have  $\forall x \in X. f(x) = \text{id}(X)(x)$ 
  using id_def by simp
  ultimately show  $f = \text{id}(X)$  by (rule func_eq)
qed

```

11.6 Lifting to subsets

Suppose we have a binary operation $f : X \times X \rightarrow X$ written additively as $f\langle x, y \rangle = x + y$. Such operation naturally defines another binary operation on the subsets of X that satisfies $A + B = \{x + y : x \in A, y \in B\}$. This new operation which we will call " f lifted to subsets" inherits many properties of f , such as associativity, commutativity and existence of the neutral element. This notion is useful for considering interval arithmetics.

The next definition describes the notion of a binary operation lifted to subsets. It is written in a way that might be a bit unexpected, but really it is the same as the intuitive definition, but shorter. In the definition we take a pair $p \in \text{Pow}(X) \times \text{Pow}(X)$, say $p = \langle A, B \rangle$, where $A, B \subseteq X$. Then we assign this pair of sets the set $\{f\langle x, y \rangle : x \in A, y \in B\} = \{f(x') : x' \in A \times B\}$. The set on the right hand side is the same as the image of $A \times B$ under f . In the definition we don't use A and B symbols, but write $\text{fst}(p)$ and $\text{snd}(p)$, resp. Recall that in Isabelle/ZF $\text{fst}(p)$ and $\text{snd}(p)$ denote the first and second components of an ordered pair p . See the lemma `lift_subsets_explained` for a more intuitive notation.

definition

```
Lift2Subsets (infix {lifted to subsets of} 65) where
  f {lifted to subsets of} X  $\equiv$ 
     $\{\langle p, f(\text{fst}(p) \times \text{snd}(p)) \rangle. p \in \text{Pow}(X) \times \text{Pow}(X)\}$ 
```

The lift to subsets defines a binary operation on the subsets.

```
lemma lift_subsets_binop: assumes A1:  $f : X \times X \rightarrow Y$ 
  shows  $(f \text{ {lifted to subsets of} } X) : \text{Pow}(X) \times \text{Pow}(X) \rightarrow \text{Pow}(Y)$ 
proof -
  let F =  $\{\langle p, f(\text{fst}(p) \times \text{snd}(p)) \rangle. p \in \text{Pow}(X) \times \text{Pow}(X)\}$ 
  from A1 have  $\forall p \in \text{Pow}(X) \times \text{Pow}(X). f(\text{fst}(p) \times \text{snd}(p)) \in \text{Pow}(Y)$ 
    using func1_1_L6 by simp
  then have  $F : \text{Pow}(X) \times \text{Pow}(X) \rightarrow \text{Pow}(Y)$ 
    by (rule ZF_fun_from_total)
  then show thesis unfolding Lift2Subsets_def by simp
qed
```

The definition of the lift to subsets rewritten in a more intuitive notation. We would like to write the last assertion as $F\langle A, B \rangle = \{f\langle x, y \rangle. x \in A, y \in B\}$, but Isabelle/ZF does not allow such syntax.

```
lemma lift_subsets_explained: assumes A1:  $f : X \times X \rightarrow Y$ 
  and A2:  $A \subseteq X \quad B \subseteq X$  and A3:  $F = f \text{ {lifted to subsets of} } X$ 
  shows
     $F\langle A, B \rangle \subseteq Y$  and
     $F\langle A, B \rangle = f(A \times B)$ 
     $F\langle A, B \rangle = \{f\langle p \rangle. p \in A \times B\}$ 
     $F\langle A, B \rangle = \{f\langle x, y \rangle. \langle x, y \rangle \in A \times B\}$ 
proof -
  let p =  $\langle A, B \rangle$ 
  from assms have
    I:  $F : \text{Pow}(X) \times \text{Pow}(X) \rightarrow \text{Pow}(Y)$  and  $p \in \text{Pow}(X) \times \text{Pow}(X)$ 
    using lift_subsets_binop by auto
  moreover from A3 have  $F = \{\langle p, f(\text{fst}(p) \times \text{snd}(p)) \rangle. p \in \text{Pow}(X) \times \text{Pow}(X)\}$ 
    unfolding Lift2Subsets_def by simp
  ultimately show  $F\langle A, B \rangle = f(A \times B)$ 
    using ZF_fun_from_tot_val by auto
also
```

```

11.7 Distributive operations

In this section we deal with pairs of operations such that one is distributive with respect to the other, that is $a \cdot (b+c) = a \cdot b + a \cdot c$ and $(b+c) \cdot a = b \cdot a + c \cdot a$. We show that this property is preserved under restriction to a set closed with respect to both operations. In `EquivClass1` theory we show that this property is preserved by projections to the quotient space if both operations are congruent with respect to the equivalence relation.

We define distributivity as a statement about three sets. The first set is the set on which the operations act. The second set is the additive operation (a ZF function) and the third is the multiplicative operation.

definition

```

IsDistributive(X,A,M) ≡ (∀ a∈X. ∀ b∈X. ∀ c∈X.
  M⟨a,A⟨b,c⟩⟩ = A⟨M⟨a,b⟩,M⟨a,c⟩⟩ ∧
  M⟨A⟨b,c⟩,a⟩ = A⟨M⟨b,a⟩,M⟨c,a⟩⟩)

```

The essential condition to show that distributivity is preserved by restrictions to sets that are closed with respect to both operations.

lemma func_ZF_7_L1:

```

  assumes A1: IsDistributive(X,A,M)

12.2 Functions in cartesian products

In this section we consider maps arising naturally in cartesian products.

There is a natural bijection between $X = Y \times \{y\}$ (a "slice") and Y . We will call this the $\text{SliceProjection}(Y \times \{y\})$. This is really the ZF equivalent of the meta-function $\text{fst}(x)$.

definition

$\text{SliceProjection}(X) \equiv \{\langle p, \text{fst}(p) \rangle \mid p \in X\}$

A slice projection is a bijection between $X \times \{y\}$ and X .

lemma slice_proj_bij: shows

$\text{SliceProjection}(X \times \{y\}) : X \times \{y\} \rightarrow X$
 $\text{domain}(\text{SliceProjection}(X \times \{y\})) = X \times \{y\}$
 $\forall p \in X \times \{y\}. \text{SliceProjection}(X \times \{y\})(p) = \text{fst}(p)$
 $\text{SliceProjection}(X \times \{y\}) \in \text{bij}(X \times \{y\}, X)$

proof -

let $P = \text{SliceProjection}(X \times \{y\})$
 have $\forall p \in X \times \{y\}. \text{fst}(p) \in X$ by simp
 moreover from this have
 $\{\langle p, \text{fst}(p) \rangle \mid p \in X \times \{y\}\} : X \times \{y\} \rightarrow X$
 by (rule ZF_fun_from_total)
 ultimately show
 $I: P : X \times \{y\} \rightarrow X$ and $II: \forall p \in X \times \{y\}. P(p) = \text{fst}(p)$
 using ZF_fun_from_tot_val SliceProjection_def by auto
 hence
 $\forall a \in X \times \{y\}. \forall b \in X \times \{y\}. P(a) = P(b) \longrightarrow a=b$
 by auto
 with I have $P \in \text{inj}(X \times \{y\}, X)$ using inj_def
 by simp
 moreover from II have $\forall x \in X. \exists p \in X \times \{y\}. P(p) = x$

12.3 Induced relations and order isomorphisms

When we have two sets X, Y , function $f : X \rightarrow Y$ and a relation R on Y we can define a relation r on X by saying that $x r y$ if and only if

$f(x) R f(y)$. This is especially interesting when f is a bijection as all reasonable properties of R are inherited by r . This section treats mostly the case when R is an order relation and f is a bijection. The standard Isabelle's `Order` theory defines the notion of a space of order isomorphisms between two sets relative to a relation. We expand that material proving that order isomorphisms preserve interesting properties of the relation.

We call the relation created by a relation on Y and a mapping $f : X \rightarrow Y$ the `InducedRelation(f,R)`.

definition

```
InducedRelation(f,R)  $\equiv$ 
  {p  $\in$  domain(f) $\times$ domain(f).  $\langle$ f(fst(p)),f(snd(p)) $\rangle \in R$ }
```

A reformulation of the definition of the relation induced by a function.

```
lemma def_of_ind_relA:
  assumes  $\langle$ x,y $\rangle \in$  InducedRelation(f,R)
  shows  $\langle$ f(x),f(y) $\rangle \in R$ 
  using assms InducedRelation_def by simp
```

A reformulation of the definition of the relation induced by a function, kind of converse of `def_of_ind_relA`.

```
lemma def_of_ind_relB: assumes f:A $\rightarrow$ B and
  x $\in$ A y $\in$ A and  $\langle$ f(x),f(y) $\rangle \in R$ 
  shows  $\langle$ x,y $\rangle \in$  InducedRelation(f,R)
  using assms func1_1_L1 InducedRelation_def by simp
```

A property of order isomorphisms that is missing from standard Isabelle's `Order.thy`.

```
lemma ord_iso_apply_conv:
  assumes f  $\in$  ord_iso(A,r,B,R) and
   $\langle$ f(x),f(y) $\rangle \in R$  and x $\in$ A y $\in$ A
  shows  $\langle$ x,y $\rangle \in r$ 
  using assms ord_iso_def by simp
```

The next lemma tells us where the induced relation is defined

```
lemma ind_rel_domain:
  assumes R  $\subseteq$  B $\times$ B and f:A $\rightarrow$ B
  shows InducedRelation(f,R)  $\subseteq$  A $\times$ A
  using assms func1_1_L1 InducedRelation_def
  by auto
```

A bijection is an order homomorphisms between a relation and the induced one.

```

13 Finite sets - introduction

```
theory Finite_ZF imports ZF1 Nat_ZF_IML ZF.Cardinal
```

```
begin
```

Standard Isabelle Finite.thy contains a very useful notion of finite powerset: the set of finite subsets of a given set. The definition, however, is specific to Isabelle and based on the notion of "datatype", obviously not something that belongs to ZF set theory. This theory file devolops the notion of finite powerset similarly as in Finite.thy, but based on standard library's Cardinal.thy. This theory file is intended to replace IsarMathLib's `Finite1` and `Finite_ZF_1` theories that are currently derived from the "datatype" approach.

13.1 Definition and basic properties of finite powerset

The goal of this section is to prove an induction theorem about finite powersets: if the empty set has some property and this property is preserved by adding a single element of a set, then this property is true for all finite subsets of this set.

We defined the finite powerset $\text{FinPow}(X)$ as those elements of the powerset that are finite.

definition

$$\text{FinPow}(X) \equiv \{A \in \text{Pow}(X) . \text{Finite}(A)\}$$

The cardinality of an element of finite powerset is a natural number.

```
lemma card_fin_is_nat: assumes A ∈ FinPow(X)
  shows |A| ∈ nat and A ≈ |A|
  using assms FinPow_def Finite_def cardinal_cong nat_into_Card
    Card_cardinal_eq by auto
```

A reformulation of `card_fin_is_nat`: for a finit set A there is a bijection between $|A|$ and A .

```
lemma fin_bij_card: assumes A1: A ∈ FinPow(X)
  shows ∃b. b ∈ bij(|A|, A)
```

proof -

```
  from A1 have |A| ≈ A using card_fin_is_nat eqpoll_sym
    by blast
  then show thesis using eqpoll_def by auto
qed
```

If a set has the same number of elements as $n \in \mathbb{N}$, then its cardinality is n . Recall that in set theory a natural number n is a set that has n elements.

```
lemma card_card: assumes A ≈ n and n ∈ nat
  shows |A| = n
  using assms cardinal_cong nat_into_Card Card_cardinal_eq
  by auto
```

If we add a point to a finite set, the cardinality increases by one. To understand the second assertion $|A \cup \{a\}| = |A| \cup \{|A|\}$ recall that the cardinality $|A|$ of A is a natural number and for natural numbers we have $n+1 = n \cup \{n\}$.

```
lemma card_fin_add_one: assumes A1: A ∈ FinPow(X) and A2: a ∈ X-A
  shows
    |A ∪ {a}| = succ( |A| )
    |A ∪ {a}| = |A| ∪ {|A|}
proof -
  from A1 A2 have cons(a,A) ≈ cons( |A|, |A| )
    using card_fin_is_nat mem_not_refl cons_eqpoll_cong
    by auto
  moreover have cons(a,A) = A ∪ {a} by (rule consdef)
  moreover have cons( |A|, |A| ) = |A| ∪ {|A|}
    by (rule consdef)
  ultimately have A ∪ {a} ≈ succ( |A| ) using succ_explained
    by simp
  with A1 show
    |A ∪ {a}| = succ( |A| ) and |A ∪ {a}| = |A| ∪ {|A|}
    using card_fin_is_nat card_card by auto
qed
```

We can decompose the finite powerset into collection of sets of the same natural cardinalities.

```
lemma finpow_decomp:
  shows FinPow(X) = (⋃ n ∈ nat. {A ∈ Pow(X). A ≈ n})
  using Finite_def FinPow_def by auto
```

Finite powerset is the union of sets of cardinality bounded by natural numbers.

```
lemma finpow_union_card_nat:
  shows FinPow(X) = (⋃ n ∈ nat. {A ∈ Pow(X). A ≲ n})
proof -
  have FinPow(X) ⊆ (⋃ n ∈ nat. {A ∈ Pow(X). A ≲ n})
    using finpow_decomp FinPow_def eqpoll_imp_lepoll
    by auto
  moreover have
    (⋃ n ∈ nat. {A ∈ Pow(X). A ≲ n}) ⊆ FinPow(X)
    using lepoll_nat_imp_Finite FinPow_def by auto
  ultimately show thesis by auto
qed
```

A different form of `finpow_union_card_nat` (see above) - a subset that has not more elements than a given natural number is in the finite powerset.

```
lemma lepoll_nat_in_finpow:
  assumes n ∈ nat    A ⊆ X  A ≲ n
  shows A ∈ FinPow(X)
  using assms finpow_union_card_nat by auto
```

Natural numbers are finite subsets of the set of natural numbers.

```
lemma nat_finpow_nat: assumes n ∈ nat shows n ∈ FinPow(nat)
  using assms nat_into_Finite nat_subset_nat FinPow_def
  by simp
```

A finite subset is a finite subset of itself.

```
lemma fin_finpow_self: assumes A ∈ FinPow(X) shows A ∈ FinPow(A)
  using assms FinPow_def by auto
```

If we remove an element and put it back we get the set back.

```
lemma rem_add_eq: assumes a ∈ A shows (A - {a}) ∪ {a} = A
  using assms by auto
```

Induction for finite powerset. This is similar to the standard Isabelle's `Fin_induct`.

```
theorem FinPow_induct: assumes A1: P(0) and

14 Finite sets

```

theory Finite1 imports ZF.EquivClass ZF.Finite func1 ZF1

```

```

begin

```

This theory extends Isabelle standard `Finite` theory. It is obsolete and should not be used for new development. Use the `Finite_ZF` instead.

14.1 Finite powerset

In this section we consider various properties of `Fin` datatype (even though there are no datatypes in ZF set theory).

In `Topology_ZF` theory we consider induced topology that is obtained by taking a subset of a topological space. To show that a topology restricted to a subset is also a topology on that subset we may need a fact that if T is a collection of sets and A is a set then every finite collection $\{V_i\}$ is of the form $V_i = U_i \cap A$, where $\{U_i\}$ is a finite subcollection of T . This is one of those trivial facts that require suprisingly long formal proof. Actually, the need for this fact is avoided by requiring intersection two open sets to be open (rather than intersection of a finite number of open sets). Still, the fact is left here as an example of a proof by induction. We will use `Fin_induct` lemma from `Finite.thy`. First we define a property of finite sets that we want to show.

definition

$\text{Prfin}(T, A, M) \equiv (M = 0) \mid (\exists N \in \text{Fin}(T). \forall V \in M. \exists U \in N. (V = U \cap A))$

Now we show the main induction step in a separate lemma. This will make the proof of the theorem `FinRestr` below look short and nice. The premises of the `ind_step` lemma are those needed by the main induction step in lemma `Fin_induct` (see standard Isabelle's `Finite.thy`).

lemma `ind_step`: assumes $A: \forall V \in TA. \exists U \in T. V = U \cap A$
 and $A1: W \in TA$ and $A2: M \in \text{Fin}(TA)$
 and $A3: W \notin M$ and $A4: \text{Prfin}(T, A, M)$
 shows $\text{Prfin}(T, A, \text{cons}(W, M))$

proof -

{ assume $A7: M=0$ have $\text{Prfin}(T, A, \text{cons}(W, M))$

proof-

from $A1$ A obtain U where $A5: U \in T$ and $A6: W = U \cap A$ by fast

let $N = \{U\}$

from $A5$ have $T1: N \in \text{Fin}(T)$ by simp

from $A7$ $A6$ have $T2: \forall V \in \text{cons}(W, M). \exists U \in N. V = U \cap A$ by simp

from $A7$ $T1$ $T2$ show $\text{Prfin}(T, A, \text{cons}(W, M))$

using `Prfin_def` by auto

qed }

moreover

{ assume $A8: M \neq 0$ have $\text{Prfin}(T, A, \text{cons}(W, M))$

proof-

from $A1$ A obtain U where $A5: U \in T$ and $A6: W = U \cap A$ by fast

from $A8$ $A4$ obtain $N0$

where $A9: N0 \in \text{Fin}(T)$ and $A10: \forall V \in M. \exists U0 \in N0. (V = U0 \cap A)$

using `Prfin_def` by auto

let $N = \text{cons}(U, N0)$

from $A5$ $A9$ have $N \in \text{Fin}(T)$ by simp

moreover from $A10$ $A6$ have $\forall V \in \text{cons}(W, M). \exists U \in N. V = U \cap A$ by simp

ultimately have $\exists N \in \text{Fin}(T). \forall V \in \text{cons}(W, M). \exists U \in N. V = U \cap A$ by auto

with $A8$ show $\text{Prfin}(T, A, \text{cons}(W, M))$

using `Prfin_def` by simp

qed }

ultimately show thesis by auto

qed

Now we are ready to prove the statement we need.

theorem `FinRestr0`: assumes $A: \forall V \in TA. \exists U \in T. V = U \cap A$
 shows $\forall M \in \text{Fin}(TA). \text{Prfin}(T, A, M)$

proof -

{ fix M

assume $M \in \text{Fin}(TA)$

moreover have $\text{Prfin}(T, A, 0)$ using `Prfin_def` by simp

moreover

{ fix $W \in M$ assume $W \in TA$ $M \in \text{Fin}(TA)$ $W \notin M$ $\text{Prfin}(T, A, M)$

with A have $\text{Prfin}(T, A, \text{cons}(W, M))$ by (rule `ind_step`) }

ultimately have $\text{Prfin}(T, A, M)$ by (rule `Fin_induct`)

```

    } thus thesis by simp
qed

```

This is a different form of the above theorem:

```

theorem ZF1FinRestr:
  assumes A1:M∈ Fin(TA) and A2: M≠0
  and A3: ∀ V∈ TA. ∃ U∈ T. V=U∩A
  shows ∃N∈ Fin(T). (∀V∈ M. ∃ U∈ N. (V = U∩A)) ∧ N≠0
proof -
  from A3 A1 have Prfin(T,A,M) using FinRestr0 by blast
  then have ∃N∈ Fin(T). ∀V∈ M. ∃ U∈ N. (V = U∩A)
    using A2 Prfin_def by simp
  then obtain N where
    D1:N∈ Fin(T) ∧ (∀V∈ M. ∃ U∈ N. (V = U∩A)) by auto
  with A2 have N≠0 by auto
  with D1 show thesis by auto
qed

```

    moreover from A1 have  $\bigcup 0 \in C$  by simp
  moreover
  { fix A N
    assume  $A \in C$   $N \in \text{Fin}(C)$   $A \notin N$   $\bigcup N \in C$ 
    with A2 have  $\bigcup \text{cons}(A, N) \in C$  by (rule Finite1_L3_IndStep) }
  ultimately show  $\bigcup N \in C$  by (rule Fin_induct)
qed

```

A collection closed with respect to taking a intersection of two sets is closed under taking finite intersections. Proof by induction with the induction step formulated in a separate lemma. This is slightly more involved than the union case in `Finite1_L3`, because the intersection of empty collection is undefined (or should be treated as such). To simplify notation we define the property to be proven for finite sets as a separate notion.

definition

$$\text{IntPr}(T, N) \equiv (N = 0 \mid \bigcap N \in T)$$

The induction step.

```

lemma Finite1_L4_IndStep:
  assumes A1:  $\forall A B. ((A \in T \wedge B \in T) \longrightarrow A \cap B \in T)$ 
  and A2:  $A \in T$  and A3:  $N \in \text{Fin}(T)$  and A4:  $A \notin N$  and A5:  $\text{IntPr}(T, N)$ 
  shows  $\text{IntPr}(T, \text{cons}(A, N))$

```

ultimately show $\text{IntPr}(T, N)$ by (rule Fin_induct)
qed

Next is a restatement of the above lemma that does not depend on the IntPr meta-function.

lemma Finite1_L5 :
 assumes $A1: \forall A B. ((A \in T \wedge B \in T) \longrightarrow A \cap B \in T)$
 and $A2: N \neq 0$ and $A3: N \in \text{Fin}(T)$
 shows $\bigcap N \in T$
proof -
 from $A1$ $A3$ have $\text{IntPr}(T, N)$ using Finite1_L4 by simp
 with $A2$ show thesis using IntPr_def by simp
 qed

The images of finite subsets by a meta-function are finite. For example in topology if we have a finite collection of sets, then closing each of them results in a finite collection of closed sets. This is a very useful lemma with many unexpected applications. The proof is by induction. The next lemma is the induction step.

lemma $\text{fin_image_fin_IndStep}$:
 assumes $\forall V \in B. K(V) \in C$
 and $U \in B$ and $N \in \text{Fin}(B)$ and $U \notin N$ and $\{K(V). V \in N\} \in \text{Fin}(C)$
 shows $\{K(V). V \in \text{cons}(U, N)\} \in \text{Fin}(C)$
 using assms by simp

The lemma:

lemma fin_image_fin :
 assumes $A1: \forall V \in B. K(V) \in C$ and $A2: N \in \text{Fin}(B)$
 shows $\{K(V). V \in N\} \in \text{Fin}(C)$
proof -
 note $A2$
 moreover have $\{K(V). V \in 0\} \in \text{Fin}(C)$ by simp
 moreover
 { fix $U \in N$
 assume $U \in B$ $N \in \text{Fin}(B)$ $U \notin N$ $\{K(V). V \in N\} \in \text{Fin}(C)$

16.2 Order isomorphisms of finite sets

In this section we establish that if two linearly ordered finite sets have the same number of elements, then they are order-isomorphic and the isomorphism is unique. This allows us to talk about "enumeration" of a linearly ordered finite set. We define the enumeration as the order isomorphism between the number of elements of the set (which is a natural number $n = \{0, 1, \dots, n-1\}$) and the set.

A really weird corner case - empty set is order isomorphic with itself.

```

lemma empty_ord_iso: shows ord_iso(0,r,0,R) ≠ 0

      by auto
  qed
  then show ord_iso(0,r,0,R) = {0} using empty_ord_iso_uniq
  by blast
qed

```

An induction (or maybe recursion?) scheme for linearly ordered sets. The induction step is that we show that if the property holds when the set is a singleton or for a set with the maximum removed, then it holds for the set. The idea is that since we can build any finite set by adding elements on the right, then if the property holds for the empty set and is invariant with respect to this operation, then it must hold for all finite sets.

```

lemma fin_ord_induction:
  assumes A1: IsLinOrder(X,r) and A2: P(0) and
  A3:  $\forall A \in \text{FinPow}(X). A \neq 0 \longrightarrow (P(A - \{\text{Maximum}(r,A)\}) \longrightarrow P(A))$

17 Equivalence relations

```
theory EquivClass1 imports ZF.EquivClass func_ZF ZF1
```

```
begin
```

In this theory file we extend the work on equivalence relations done in the standard Isabelle's EquivClass theory. That development is very good and all, but we really would prefer an approach contained within the a standard ZF set theory, without extensions specific to Isabelle. That is why this theory is written.

17.1 Congruent functions and projections on the quotient

Suppose we have a set X with a relation $r \subseteq X \times X$ and a function $f : X \rightarrow X$. The function f can be compatible (congruent) with r in the sense that if two elements x, y are related then the values $f(x), f(y)$ are also related. This is especially useful if r is an equivalence relation as it allows to "project" the function to the quotient space X/r (the set of equivalence classes of r) and create a new function F that satisfies the formula $F([x]_r) = [f(x)]_r$. When f is congruent with respect to r such definition of the value of F on the equivalence class $[x]_r$ does not depend on which x we choose to represent the

class. In this section we also consider binary operations that are congruent with respect to a relation. These are important in algebra - the congruency condition allows to project the operation to obtain the operation on the quotient space.

First we define the notion of function that maps equivalent elements to equivalent values. We use similar names as in the Isabelle's standard `EquivClass` theory to indicate the conceptual correspondence of the notions.

definition

```
Congruent(r,f)  $\equiv$ 
  ( $\forall x\ y. \langle x,y \rangle \in r \longrightarrow \langle f(x),f(y) \rangle \in r$ )
```

Now we will define the projection of a function onto the quotient space. In standard math the equivalence class of x with respect to relation r is usually denoted $[x]_r$. Here we reuse notation $r\{x\}$ instead. This means the image of the set $\{x\}$ with respect to the relation, which, for equivalence relations is exactly its equivalence class if you think about it.

definition

```
ProjFun(A,r,f)  $\equiv$ 
  { $\langle c, \bigcup_{x \in c. r\{f(x)\}} \rangle. c \in (A//r)$ }
```

Elements of equivalence classes belong to the set.

```

We now define congruent functions of two variables (binary functions). The predicate `Congruent2` corresponds to `congruent2` in Isabelle's standard `EquivClass` theory, but uses ZF-functions rather than meta-functions.

definition

$$\begin{aligned}
 \text{Congruent2}(r,f) \equiv \\
 (\forall x_1 \ x_2 \ y_1 \ y_2. \langle x_1, x_2 \rangle \in r \wedge \langle y_1, y_2 \rangle \in r \longrightarrow \\
 \langle f\langle x_1, y_1 \rangle, f\langle x_2, y_2 \rangle \rangle \in r)
 \end{aligned}$$

Next we define the notion of projecting a binary operation to the quotient

space. This is a very important concept that allows to define quotient groups, among other things.

definition

$$\text{ProjFun2}(A, r, f) \equiv \{ \langle p, \bigcup z \in \text{fst}(p) \times \text{snd}(p). r\{f(z)\} \rangle. p \in (A//r) \times (A//r) \}$$

17.3 Saturated sets

In this section we consider sets that are saturated with respect to an equivalence relation. A set A is saturated with respect to a relation r if $A = r^{-1}(r(A))$. For equivalence relations saturated sets are unions of equivalence classes. This makes them useful as a tool to define subsets of the quotient space using properties of representants. Namely, we often define a set $B \subseteq X/r$ by saying that $[x]_r \in B$ iff $x \in A$. If A is a saturated set, this definition is consistent in the sense that it does not depend on the choice of x to represent $[x]_r$.

The following defines the notion of a saturated set. Recall that in Isabelle $r^{-1}(A)$ is the inverse image of A with respect to relation r . This definition is not specific to equivalence relations.

definition

$\text{IsSaturated}(r,A) \equiv A = r^{-1}(r(A))$

For equivalence relations a set is saturated iff it is an image of itself.

lemma `EquivClass_3_L1: assumes A1: equiv(X,r)`

`shows IsSaturated(r,A) \longleftrightarrow A = r(A)`

18 Finite sequences

```

theory FiniteSeq_ZF imports Nat_ZF_IML func1

```

```

begin

```

This theory treats finite sequences (i.e. maps $n \rightarrow X$, where $n = \{0, 1, \dots, n-1\}$ is a natural number) as lists. It defines and proves the properties of basic operations on lists: concatenation, appending and element etc.

18.1 Lists as finite sequences

A natural way of representing (finite) lists in set theory is through (finite) sequences. In such view a list of elements of a set X is a function that maps

the set $\{0, 1, \dots, n-1\}$ into X . Since natural numbers in set theory are defined so that $n = \{0, 1, \dots, n-1\}$, a list of length n can be understood as an element of the function space $n \rightarrow X$.

We define the set of lists with values in set X as $\text{Lists}(X)$.

definition

$$\text{Lists}(X) \equiv \bigcup_{n \in \text{nat.}} (n \rightarrow X)$$

The set of nonempty X -value listst will be called $\text{NELists}(X)$.

definition

$$\text{NELists}(X) \equiv \bigcup_{n \in \text{nat.}} (\text{succ}(n) \rightarrow X)$$

We first define the shift that moves the second sequence to the domain $\{n, \dots, n+k-1\}$, where n, k are the lengths of the first and the second sequence, resp. To understand the notation in the definitions below recall that in Isabelle/ZF $\text{pred}(n)$ is the previous natural number and denotes the difference between natural numbers n and k .

definition

$$\text{ShiftedSeq}(b, n) \equiv \{ \langle j, b(j \#- n) \rangle. j \in \text{NatInterval}(n, \text{domain}(b)) \}$$

We define concatenation of two sequences as the union of the first sequence with the shifted second sequence. The result of concatenating lists a and b is called $\text{Concat}(a, b)$.

definition

$$\text{Concat}(a, b) \equiv a \cup \text{ShiftedSeq}(b, \text{domain}(a))$$

For a finite sequence we define the sequence of all elements except the first one. This corresponds to the "tail" function in Haskell. We call it Tail here as well.

definition

$$\text{Tail}(a) \equiv \{ \langle k, a(\text{succ}(k)) \rangle. k \in \text{pred}(\text{domain}(a)) \}$$

A dual notion to Tail is the list of all elements of a list except the last one. Borrowing the terminology from Haskell again, we will call this Init .

definition

$$\text{Init}(a) \equiv \text{restrict}(a, \text{pred}(\text{domain}(a)))$$

Another obvious operation we can talk about is appending an element at the end of a sequence. This is called Append .

definition

$$\text{Append}(a, x) \equiv a \cup \{ \langle \text{domain}(a), x \rangle \}$$

If lists are modeled as finite sequences (i.e. functions on natural intervals $\{0, 1, \dots, n-1\} = n$) it is easy to get the first element of a list as the value of the sequence at 0. The last element is the value at $n-1$. To hide this behind a familiar name we define the Last element of a list.

definition

$\text{Last}(a) \equiv a(\text{pred}(\text{domain}(a)))$

Shifted sequence is a function on a the interval of natural numbers.

lemma `shifted_seq_props`:

assumes $A1: n \in \text{nat} \quad k \in \text{nat}$ and $A2: b:k \rightarrow X$

shows

$\text{ShiftedSeq}(b,n): \text{NatInterval}(n,k) \rightarrow X$

$\forall i \in \text{NatInterval}(n,k). \text{ShiftedSeq}(b,n)(i) = b(i \#- n)$

$\forall j \in k. \text{ShiftedSeq}(b,n)(n \#+ j) = b(j)$

proof -

     $b(n) = y$ 
  using assms Append_def func1_1_L1 append_props by auto

```

The next lemma is a bit displaced as it is mainly about finite sets. It is proven here because it uses the notion of `Append`. Suppose we have a list of element of A is a bijection. Then for every element that does not belong to A we can we can construct a bijection for the set $A \cup \{x\}$ by appending x . This is just a specialised version of lemma `bij_extend_point` from `func1.thy`.

```

lemma bij_append_point:
  assumes A1:  $n \in \text{nat}$  and A2:  $b \in \text{bij}(n,X)$  and A3:  $x \notin X$ 
  shows  $\text{Append}(b,x) \in \text{bij}(\text{succ}(n), X \cup \{x\})$ 

```

```

proof -

18.2 Lists and cartesian products

Lists of length n of elements of some set X can be thought of as a model of the cartesian product X^n which is more convenient in many applications.

There is a natural bijection between the space $(n+1) \rightarrow X$ of lists of length $n+1$ of elements of X and the cartesian product $(n \rightarrow X) \times X$.

```

lemma lists_cart_prod: assumes  $n \in \text{nat}$ 
  shows  $\{\langle x, \langle \text{Init}(x), x(n) \rangle \rangle. x \in \text{succ}(n) \rightarrow X\} \in \text{bij}(\text{succ}(n) \rightarrow X, (n \rightarrow X) \times X)$ 
proof -
  let f =  $\{\langle x, \langle \text{Init}(x), x(n) \rangle \rangle. x \in \text{succ}(n) \rightarrow X\}$

19 Inductive sequences

theory InductiveSeq_ZF imports Nat_ZF_IML FiniteSeq_ZF

begin

In this theory we discuss sequences defined by conditions of the form $a_0 = x$, $a_{n+1} = f(a_n)$ and similar.

19.1 Sequences defined by induction

One way of defining a sequence (that is a function $a: \mathbb{N} \rightarrow X$) is to provide the first element of the sequence and a function to find the next value when we have the current one. This is usually called "defining a sequence by induction". In this section we set up the notion of a sequence defined by induction and prove the theorems needed to use it.

First we define a helper notion of the sequence defined inductively up to a given natural number n .

definition

$\text{InductiveSequenceN}(x, f, n) \equiv$
 THE a. $a: \text{succ}(n) \rightarrow \text{domain}(f) \wedge a(0) = x \wedge (\forall k \in n. a(\text{succ}(k)) = f(a(k)))$

From that we define the inductive sequence on the whole set of natural

numbers. Recall that in Isabelle/ZF the set of natural numbers is denoted `nat`.

definition

$\text{InductiveSequence}(x, f) \equiv \bigcup_{n \in \text{nat}} \text{InductiveSequenceN}(x, f, n)$

First we will consider the question of existence and uniqueness of finite inductive sequences. The proof is by induction and the next lemma is the $P(0)$ step. To understand the notation recall that for natural numbers in set theory we have $n = \{0, 1, \dots, n-1\}$ and $\text{succ}(n) = \{0, 1, \dots, n\}$.

lemma `indseq_exun0`: **assumes** $A1: f: X \rightarrow X$ **and** $A2: x \in X$

shows

$\exists! a. a: \text{succ}(0) \rightarrow X \wedge a(0) = x \wedge (\forall k \in 0. a(\text{succ}(k)) = f(a(k)))$

proof

fix $a \ b$

assume $A3:$

$a: \text{succ}(0) \rightarrow X \wedge a(0) = x \wedge (\forall k \in 0. a(\text{succ}(k)) = f(a(k)))$

$b: \text{succ}(0) \rightarrow X \wedge b(0) = x \wedge (\forall k \in 0. b(\text{succ}(k)) = f(b(k)))$

moreover **have** $\text{succ}(0) = \{0\}$ **by** `auto`

ultimately **have** $a: \{0\} \rightarrow X$ $b: \{0\} \rightarrow X$ **by** `auto`

then **have** $a = \{\langle 0, a(0) \rangle\}$ $b = \{\langle 0, b(0) \rangle\}$ **using** `func_singleton_pair`

by `auto`

with $A3$ **show** $a=b$ **by** `simp`

next

let $a = \{\langle 0, x \rangle\}$

have $a: \{0\} \rightarrow \{x\}$ **using** `singleton_fun` **by** `simp`

moreover **from** $A1 \ A2$ **have** $\{x\} \subseteq X$ **by** `simp`

ultimately **have** $a: \{0\} \rightarrow X$

using `func1_1_L1B` **by** `blast`

moreover **have** $\{0\} = \text{succ}(0)$ **by** `auto`

ultimately **have** $a: \text{succ}(0) \rightarrow X$ **by** `simp`

with $A1$ **show**

$\exists a. a: \text{succ}(0) \rightarrow X \wedge a(0) = x \wedge (\forall k \in 0. a(\text{succ}(k)) = f(a(k)))$

using `singleton_apply` **by** `auto`

qed

A lemma about restricting finite sequences needed for the proof of the inductive step of the existence and uniqueness of finite inductive sequences.

lemma `indseq_restrict`:

assumes $A1: f: X \rightarrow X$ **and** $A2: x \in X$ **and** $A3: n \in \text{nat}$ **and**

$A4: a: \text{succ}(\text{succ}(n)) \rightarrow X \wedge a(0) = x \wedge (\forall k \in \text{succ}(n). a(\text{succ}(k)) = f(a(k)))$

and $A5: a_r = \text{restrict}(a, \text{succ}(n))$

shows

$a_r: \text{succ}(n) \rightarrow X \wedge a_r(0) = x \wedge (\forall k \in n. a_r(\text{succ}(k)) = f(a_r(k)))$

proof -

from $A3$ **have** $\text{succ}(n) \subseteq \text{succ}(\text{succ}(n))$ **by** `auto`

with $A4 \ A5$ **have** $a_r: \text{succ}(n) \rightarrow X$ **using** `restrict_type2` **by** `auto`

moreover

from $A3$ **have** $0 \in \text{succ}(n)$ **using** `empty_in_every_succ` **by** `simp`

```

with A4 A5 have  $a_r(0) = x$  using restrict_if by simp
moreover from A3 A4 A5 have  $\forall k \in n. a_r(\text{succ}(k)) = f(a_r(k))$ 
  using succ_ineq restrict_if by auto
ultimately show thesis by simp

19.2 Images of inductive sequences

In this section we consider the properties of sets that are images of inductive sequences, that is are of the form $\{f^{(n)}(x) : n \in N\}$ for some x in the domain of f , where $f^{(n)}$ denotes the n 'th iteration of the function f . For a function $f : X \rightarrow X$ and a point $x \in X$ such set is sometimes called the orbit of x generated by f .

The basic properties of orbits.

19.3 Subsets generated by a binary operation

In algebra we often talk about sets "generated" by an element, that is sets of the form (in multiplicative notation) $\{a^n | n \in Z\}$. This is related to a general notion of "power" (as in $a^n = a \cdot a \cdot \dots \cdot a$) or multiplicity $n \cdot a = a + a + \dots + a$. The intuitive meaning of such notions is obvious, but we need to do some work to be able to use it in the formalized setting. This section is devoted to sequences that are created by repeatedly applying a binary operation with the second argument fixed to some constant.

Basic properties of sets generated by binary operations.

```

theorem binop_gen_set:

```

```

assumes A1:  $f: X \times Y \rightarrow X$  and A2:  $x \in X \ y \in Y$  and
A3:  $a = \text{InductiveSequence}(x, \text{Fix2ndVar}(f, y))$ 
shows
 $a : \text{nat} \rightarrow X$ 
 $a(\text{nat}) \in \text{Pow}(X)$ 
 $x \in a(\text{nat})$ 
 $\forall z \in a(\text{nat}). \text{Fix2ndVar}(f, y)(z) \in a(\text{nat})$ 
proof -

19.4 Inductive sequences with changing generating function

A seemingly more general form of a sequence defined by induction is a sequence generated by the difference equation $x_{n+1} = f_n(x_n)$ where $n \mapsto f_n$ is a given sequence of functions such that each maps X into itself. For example when $f_n(x) := x + x_n$ then the equation $S_{n+1} = f_n(S_n)$ describes the sequence $n \mapsto S_n = s_0 + \sum_{i=0}^n x_i$, i.e. the sequence of partial sums of the sequence $\{s_0, x_0, x_1, x_2, \dots\}$.

The situation where the function that we iterate changes with n can be derived from the simpler case if we define the generating function appropriately. Namely, we replace the generating function in the definitions of `InductiveSequenceN` by the function $f : X \times n \rightarrow X \times n$, $f\langle x, k \rangle = \langle f_k(x), k+1 \rangle$ if $k < n$, $\langle f_k(x), k \rangle$ otherwise. The first notion defines the expression we will use to define the generating function. To understand the notation recall that in standard Isabelle/ZF for a pair $s = \langle x, n \rangle$ we have $\text{fst}(s) = x$ and $\text{snd}(s) = n$.

definition

```

StateTransfFunNMeta(F, n, s)  $\equiv$ 
  if ( $\text{snd}(s) \in n$ ) then  $\langle F(\text{snd}(s))(\text{fst}(s)), \text{succ}(\text{snd}(s)) \rangle$  else s

```

Then we define the actual generating function on sets of pairs from $X \times \{0, 1, \dots, n\}$.

definition

```

StateTransfFunN(X, F, n)  $\equiv \{ \langle s, \text{StateTransfFunNMeta}(F, n, s) \rangle. s \in X \times \text{succ}(n) \}$ 

```

Having the generating function we can define the expression that we can use to define the inductive sequence generates.

definition

```

StatesSeq(x, X, F, n)  $\equiv$ 
  InductiveSequenceN( $\langle x, 0 \rangle$ , StateTransfFunN(X, F, n), n)

```

Finally we can define the sequence given by a initial point x , and a sequence F of n functions.

definition

$\text{InductiveSeqVarFN}(x, X, F, n) \equiv \{\langle k, \text{fst}(\text{StatesSeq}(x, X, F, n)(k)) \rangle \mid k \in \text{succ}(n)\}$

The state transformation function (StateTransfFunN) is a function that transforms $X \times n$ into itself.

lemma state_trans_fun : **assumes** $A1: n \in \text{nat}$ **and** $A2: F: n \rightarrow (X \rightarrow X)$

shows $\text{StateTransfFunN}(X, F, n): X \times \text{succ}(n) \rightarrow X \times \text{succ}(n)$

proof -

```

20 Enumerations

```
theory Enumeration_ZF imports NatOrder_ZF FiniteSeq_ZF FinOrd_ZF
```

```
begin
```

Suppose r is a linear order on a set A that has n elements, where $n \in \mathbb{N}$. In the `FinOrd_ZF` theory we prove a theorem stating that there is a unique order isomorphism between $n = \{0, 1, \dots, n-1\}$ (with natural order) and A . Another way of stating that is that there is a unique way of counting the elements of A in the order increasing according to relation r . Yet another way of stating the same thing is that there is a unique sorted list of elements of A . We will call this list the `Enumeration` of A .

20.1 Enumerations: definition and notation

In this section we introduce the notion of enumeration and define a proof context (a "locale" in Isabelle terms) that sets up the notation for writing about enumerations.

We define enumeration as the only order isomorphism between a set A and the number of its elements. We are using the formula $\bigcup\{x\} = x$ to extract the only element from a singleton. `Le` is the (natural) order on natural numbers, defined in `Nat_ZF` theory in the standard Isabelle library.

definition

$$\text{Enumeration}(A, r) \equiv \bigcup \text{ord_iso}(|A|, \text{Le}, A, r)$$

To set up the notation we define a locale `enums`. In this locale we will assume that r is a linear order on some set X . In most applications this set will be just the set of natural numbers. Standard Isabelle uses \leq to denote the "less or equal" relation on natural numbers. We will use the \leq symbol to denote the relation r . Those two symbols usually look the same in the presentation, but they are different in the source. To shorten the notation the enumeration `Enumeration(A, r)` will be denoted as $\sigma(A)$. Similarly as in the `Semigroup` theory we will write $a \leftarrow x$ for the result of appending an element x to the finite sequence (list) a . Finally, $a \sqcup b$ will denote the concatenation of the lists a and b .

```
locale enums =
```

```
  fixes X r
```

```
  assumes linord: IsLinOrder(X, r)
```

```
  fixes ler (infix ≤ 70)
```

```

21 Folding in ZF

theory Fold_ZF imports InductiveSeq_ZF

begin

Suppose we have a binary operation $P : X \times X \rightarrow X$ written multiplicatively as $P\langle x, y \rangle = x \cdot y$. In informal mathematics we can take a sequence $\{x_k\}_{k \in 0..n}$ of elements of X and consider the product $x_0 \cdot x_1 \cdot \dots \cdot x_n$. To do the same thing

in formalized mathematics we have to define precisely what is meant by that "...". The definition we want to use is based on the notion of sequence defined by induction discussed in `InductiveSeq_ZF`. We don't really want to derive the terminology for this from the word "product" as that would tie it conceptually to the multiplicative notation. This would be awkward when we want to reuse the same notions to talk about sums like $x_0 + x_1 + \dots + x_n$. In functional programming there is something called "fold". Namely for a function f , initial point a and list $[b, c, d]$ the expression `fold(f, a, [b,c,d])` is defined to be $f(f(f(a,b),c),d)$ (in Haskell something like this is called `foldl`). If we write f in multiplicative notation we get $a \cdot b \cdot c \cdot d$, so this is exactly what we need. The notion of folds in functional programming is actually much more general than what we need here (not that I know anything about that). In this theory file we just make a slight generalization and talk about folding a list with a binary operation $f : X \times Y \rightarrow X$ with X not necessarily the same as Y .

21.1 Folding in ZF

Suppose we have a binary operation $f : X \times Y \rightarrow X$. Then every $y \in Y$ defines a transformation of X defined by $T_y(x) = f(x, y)$. In `IsarMathLib` such transformation is called as `Fix2ndVar(f,y)`. Using this notion, given a function $f : X \times Y \rightarrow X$ and a sequence $y = \{y_k\}_{k \in N}$ of elements of Y we can get a sequence of transformations of X . This is defined in `Seq2TransSeq` below. Then we use that sequence of transformations to define the sequence of partial folds (called `FoldSeq`) by means of `InductiveSeqVarFN` (defined in `InductiveSeq_ZF` theory) which implements the inductive sequence determined by a starting point and a sequence of transformations. Finally, we define the fold of a sequence as the last element of the sequence of the partial folds.

Definition that specifies how to convert a sequence a of elements of Y into a sequence of transformations of X , given a binary operation $f : X \times Y \rightarrow X$.

definition

$$\text{Seq2TrSeq}(f, a) \equiv \{\langle k, \text{Fix2ndVar}(f, a(k)) \rangle \mid k \in \text{domain}(a)\}$$

Definition of a sequence of partial folds.

definition

$$\begin{aligned} \text{FoldSeq}(f, x, a) &\equiv \\ &\text{InductiveSeqVarFN}(x, \text{fstDom}(f), \text{Seq2TrSeq}(f, a), \text{domain}(a)) \end{aligned}$$

Definition of a fold.

definition

$$\text{Fold}(f, x, a) \equiv \text{Last}(\text{FoldSeq}(f, x, a))$$

If X is a set with a binary operation $f : X \times Y \rightarrow X$ then $\text{Seq2TransSeqN}(f, a)$ converts a sequence a of elements of Y into the sequence of corresponding transformations of X .

lemma seq2trans_seq_props:

assumes A1: $n \in \text{nat}$ and A2: $f : X \times Y \rightarrow X$ and A3: $a: n \rightarrow Y$ and
A4: $T = \text{Seq2TrSeq}(f, a)$
shows
 $T : n \rightarrow (X \rightarrow X)$ and
 $\forall k \in n. \forall x \in X. (T(k))(x) = f(x, a(k))$

proof -

from $\langle a: n \rightarrow Y \rangle$ have D: $\text{domain}(a) = n$ using func1_1_L1 by simp
with A2 A3 A4 show $T : n \rightarrow (X \rightarrow X)$

22 Partitions of sets

theory Partitions_ZF **imports** Finite_ZF FiniteSeq_ZF

begin

It is a common trick in proofs that we divide a set into non-overlapping subsets. The first case is when we split the set into two nonempty disjoint sets. Here this is modeled as an ordered pair of sets and the set of such divisions of set X is called $\text{Bisections}(X)$. The second variation on this theme is a set-valued function (aren't they all in ZF?) whose values are nonempty and mutually disjoint.

22.1 Bisections

This section is about dividing sets into two non-overlapping subsets.

The set of bisections of a given set A is a set of pairs of nonempty subsets of A that do not overlap and their union is equal to A .

definition

$$\text{Bisections}(X) = \{p \in \text{Pow}(X) \times \text{Pow}(X) . \\ \text{fst}(p) \neq 0 \wedge \text{snd}(p) \neq 0 \wedge \text{fst}(p) \cap \text{snd}(p) = 0 \wedge \text{fst}(p) \cup \text{snd}(p) = X\}$$

Properties of bisections.

lemma bisec_props: **assumes** $\langle A, B \rangle \in \text{Bisections}(X)$ **shows**
 $A \neq 0 \quad B \neq 0 \quad A \subseteq X \quad B \subseteq X \quad A \cap B = 0 \quad A \cup B = X \quad X \neq 0$
using assms Bisections_def **by** auto

Kind of inverse of bisec_props: a pair of nonempty disjoint sets form a bisection of their union.

lemma is_bisec:

assumes $A \neq 0 \quad B \neq 0 \quad A \cap B = 0$
shows $\langle A, B \rangle \in \text{Bisections}(A \cup B)$ **using** assms Bisections_def
by auto

Bisection of X is a pair of subsets of X .

```
lemma bisec_is_pair: assumes Q ∈ Bisections(X)
  shows Q = ⟨fst(Q), snd(Q)⟩
  using assms Bisections_def by auto
```

The set of bisections of the empty set is empty.

```
lemma bisec_empty: shows Bisections(0) = 0
  using Bisections_def by auto
```

The next lemma shows what can we say about bisections of a set with another element added.

```
lemma bisec_add_point:
  assumes A1:  $x \notin X$  and A2:  $\langle A, B \rangle \in \text{Bisections}(X \cup \{x\})$ 
  shows  $(A = \{x\} \vee B = \{x\}) \vee (\langle A - \{x\}, B - \{x\} \rangle \in \text{Bisections}(X))$ 
  proof -
    { assume  $A \neq \{x\}$  and  $B \neq \{x\}$ 
      with A2 have  $A - \{x\} \neq 0$  and  $B - \{x\} \neq 0$ 
    }
    using singl_diff_empty Bisections_def
    by auto
    moreover have  $(A - \{x\}) \cup (B - \{x\}) = X$ 
    proof -
      have  $(A - \{x\}) \cup (B - \{x\}) = (A \cup B) - \{x\}$ 
      by auto
      also from assms have  $(A \cup B) - \{x\} = X$ 
      using Bisections_def by auto
    finally show thesis by simp
    qed
    moreover from A2 have  $(A - \{x\}) \cap (B - \{x\}) = 0$ 
    using Bisections_def by auto
    ultimately have  $\langle A - \{x\}, B - \{x\} \rangle \in \text{Bisections}(X)$ 
    using Bisections_def by auto
  } thus thesis by auto
qed
```

A continuation of the lemma bisec_add_point that refines the case when the pair with removed point bisects the original set.

```
lemma bisec_add_point_case3:
  assumes A1:  $\langle A, B \rangle \in \text{Bisections}(X \cup \{x\})$ 
  and A2:  $\langle A - \{x\}, B - \{x\} \rangle \in \text{Bisections}(X)$ 
  shows
     $(\langle A, B - \{x\} \rangle \in \text{Bisections}(X) \wedge x \in B) \vee$ 
     $(\langle A - \{x\}, B \rangle \in \text{Bisections}(X) \wedge x \in A)$ 
  proof -
    from A1 have  $x \in A \cup B$ 
    using Bisections_def by auto
    hence  $x \in A \vee x \in B$  by simp
    from A1 have  $A - \{x\} = A \vee B - \{x\} = B$ 
    using Bisections_def by auto
```

```

moreover
{ assume A - {x} = A
  with A2 ⟨x ∈ A ∪ B⟩ have
    ⟨A, B - {x}⟩ ∈ Bisections(X) ∧ x ∈ B
    using singl_diff_eq by simp }
moreover
{ assume B - {x} = B
  with A2 ⟨x ∈ A ∪ B⟩ have
    ⟨A - {x}, B⟩ ∈ Bisections(X) ∧ x ∈ A
    using singl_diff_eq by simp }
ultimately show thesis by auto
qed

```

Another lemma about bisecting a set with an added point.

```

lemma point_set_bisec:
  assumes A1:  $x \notin X$  and A2:  $\langle \{x\}, A \rangle \in \text{Bisections}(X \cup \{x\})$ 
  shows  $A = X$  and  $X \neq 0$ 
proof -
  from A2 have  $A \subseteq X$  using Bisections_def by auto
  moreover
  { fix a assume  $a \in X$ 
    with A2 have  $a \in \{x\} \cup A$  using Bisections_def by simp
    with A1  $\langle a \in X \rangle$  have  $a \in A$  by auto }
  ultimately show  $A = X$  by auto
  with A2 show  $X \neq 0$  using Bisections_def by simp
qed

```

Yet another lemma about bisecting a set with an added point, very similar to point_set_bisec with almost the same proof.

```

lemma set_point_bisec:
  assumes A1:  $x \notin X$  and A2:  $\langle A, \{x\} \rangle \in \text{Bisections}(X \cup \{x\})$ 
  shows  $A = X$  and  $X \neq 0$ 
proof -
  from A2 have  $A \subseteq X$  using Bisections_def by auto
  moreover
  { fix a assume  $a \in X$ 
    with A2 have  $a \in A \cup \{x\}$  using Bisections_def by simp
    with A1  $\langle a \in X \rangle$  have  $a \in A$  by auto }
  ultimately show  $A = X$  by auto
  with A2 show  $X \neq 0$  using Bisections_def by simp
qed

```

If a pair of sets bisects a finite set, then both elements of the pair are finite.

```

lemma bisect_fin:
  assumes A1:  $A \in \text{FinPow}(X)$  and A2:  $Q \in \text{Bisections}(A)$ 
  shows  $\text{fst}(Q) \in \text{FinPow}(X)$  and  $\text{snd}(Q) \in \text{FinPow}(X)$ 
proof -
  from A2 have  $\langle \text{fst}(Q), \text{snd}(Q) \rangle \in \text{Bisections}(A)$ 
    using bisec_is_pair by simp

```

```

then have fst(Q)  $\subseteq$  A and snd(Q)  $\subseteq$  A
  using bisec_props by auto
with A1 show fst(Q)  $\in$  FinPow(X) and snd(Q)  $\in$  FinPow(X)
  using FinPow_def subset_Finite by auto
qed

```

22.2 Partitions

This sections covers the situation when we have an arbitrary number of sets we want to partition into.

We define a notion of a partition as a set valued function such that the values for different arguments are disjoint. The name is derived from the fact that such function "partitions" the union of its arguments. Please let me know if you have a better idea for a name for such notion. We would prefer to say "is a partition", but that reserves the letter "a" as a keyword(?) which causes problems.

definition

```

Partition (_ {is partition} [90] 91) where
P {is partition}  $\equiv \forall x \in \text{domain}(P).$ 
 $P(x) \neq 0 \wedge (\forall y \in \text{domain}(P). x \neq y \longrightarrow P(x) \cap P(y) = 0)$ 

```

A fact about lists of mutually disjoint sets.

```

lemma list_partition: assumes A1: n  $\in$  nat and
  A2: a : succ(n)  $\rightarrow$  X  a {is partition}
  shows  $(\bigcup_{i \in n}. a(i)) \cap a(n) = 0$ 
proof -
{ assume  $(\bigcup_{i \in n}. a(i)) \cap a(n) \neq 0$ 
  then have  $\exists x. x \in (\bigcup_{i \in n}. a(i)) \cap a(n)$ 
    by (rule nonempty_has_element)
  then obtain x where  $x \in (\bigcup_{i \in n}. a(i))$  and I:  $x \in a(n)$ 
    by auto
  then obtain i where  $i \in n$  and  $x \in a(i)$  by auto
  with A2 I have False
    using mem_imp_not_eq func1_1_L1 Partition_def
    by auto
} thus thesis by auto
qed

```

We can turn every injection into a partition.

```

lemma inj_partition:
  assumes A1: b  $\in$  inj(X,Y)
  shows
 $\forall x \in X. \{\langle x, \{b(x)\}\rangle. x \in X\}(x) = \{b(x)\}$  and

  } with ⟨domain(p) = X⟩ show {⟨x, {b(x)}⟩. x ∈ X} {is partition}
  using Partition_def by simp
qed

end

```

23 Quasigroups

theory Quasigroup_ZF imports func1

begin

A quasigroup is an algebraic structure that that one gets after adding (sort of) divisibility to magma. Quasigroups differ from groups in that they are not necessarily associative and they do not have to have the neutral element.

23.1 Definitions and notation

According to Wikipedia there are at least two approaches to defining a quasigroup. One defines a quasigroup as a set with a binary operation, and the other, from universal algebra, defines a quasigroup as having three primitive operations. We will use the first approach.

A quasigroup operation does not have to have the neutral element. The left division is defined as the only solution to the equation $a \cdot x = b$ (using

multiplicative notation). The next definition specifies what does it mean that an operation A has a left division on a set G .

definition

$$\text{HasLeftDiv}(G, A) \equiv \forall a \in G. \forall b \in G. \exists ! x. (x \in G \wedge A\langle a, x \rangle = b)$$

An operation A has the right inverse if for all elements $a, b \in G$ the equation $x \cdot a = b$ has a unique solution.

definition

$$\text{HasRightDiv}(G, A) \equiv \forall a \in G. \forall b \in G. \exists ! x. (x \in G \wedge A\langle x, a \rangle = b)$$

An operation that has both left and right division is said to have the Latin square property.

definition

$$\text{HasLatinSquareProp} \text{ (infix \{has Latin square property on\} 65) where } \\ A \text{ \{has Latin square property on\} } G \equiv \text{HasLeftDiv}(G, A) \wedge \text{HasRightDiv}(G, A)$$

A quasigroup is a set with a binary operation that has the Latin square property.

definition

$$\text{IsAQuasigroup}(G, A) \equiv A : G \times G \rightarrow G \wedge A \text{ \{has Latin square property on\} } G$$

The uniqueness of the left inverse allows us to define the left division as a function. The union expression as the value of the function extracts the only element of the set of solutions of the equation $x \cdot z = y$ for given $\langle x, y \rangle = p \in G \times G$ using the identity $\bigcup \{x\} = x$.

definition

$$\text{LeftDiv}(G, A) \equiv \{ \langle p, \bigcup \{z \in G. A\langle \text{fst}(p), z \rangle = \text{snd}(p) \} \rangle . p \in G \times G \}$$

Similarly the right division is defined as a function on $G \times G$.

definition

$$\text{RightDiv}(G, A) \equiv \{ \langle p, \bigcup \{z \in G. A\langle z, \text{fst}(p) \rangle = \text{snd}(p) \} \rangle . p \in G \times G \}$$

Left and right divisions are binary operations on G .

lemma `lrddiv_binop`: **assumes** `IsAQuasigroup(G, A)` **shows**

$$\text{LeftDiv}(G, A) : G \times G \rightarrow G \text{ and } \text{RightDiv}(G, A) : G \times G \rightarrow G$$

proof -

```

{ fix p assume p ∈ G × G

24 Loops

```

theory Loop_ZF imports Quasigroup_ZF

```

```

begin

```

This theory specifies the definition and proves basic properties of loops. Loops are very similar to groups, the only property that is missing is associativity of the operation.

24.1 Definitions and notation

In this section we define the notions of identity element and left and right inverse.

A loop is a quasigroup with an identity element.

```

definition IsAloop( $G, A$ )  $\equiv$  IsAQuasigroup( $G, A$ )  $\wedge$  ( $\exists e \in G. \forall x \in G. A\langle e, x \rangle = x$ 
 $\wedge A\langle x, e \rangle = x$ )

```

The neutral element for a binary operation $A : G \times G \rightarrow G$ is defined as the only element e of G such that $A\langle x, e \rangle = x$ and $A\langle e, x \rangle = x$ for all $x \in G$. Note that although the loop definition guarantees the existence of (some) such element(s) at this point we do not know if this element is unique. We can define this notion here but it will become usable only after we prove uniqueness.

definition

```
TheNeutralElement(G,f) ≡
  ( THE e. e∈G ∧ (∀ g∈G. f⟨e,g⟩ = g ∧ f⟨g,e⟩ = g))
```

We will reuse the notation defined in the `quasigroup0` locale, just adding the assumption about the existence of a neutral element and notation for it.

```
locale loop0 = quasigroup0 +
  assumes ex_ident: ∃ e∈G. ∀ x∈G. e·x = x ∧ x·e = x

  fixes neut (1)
  defines neut_def[simp]: 1 ≡ TheNeutralElement(G,A)
```

In the loop context the pair (G,A) forms a loop.

```
lemma (in loop0) is_loop: shows IsAloop(G,A)
  unfolding IsAloop_def using ex_ident qgroupassum by simp
```

If we know that a pair (G,A) forms a loop then the assumptions of the `loop0` locale hold.

```
lemma loop_loop0_valid: assumes IsAloop(G,A) shows loop0(G,A)
  using assms unfolding IsAloop_def loop0_axioms_def quasigroup0_def loop0_def
  by auto
```

The neutral element is unique in the loop.

```
lemma (in loop0) neut_uniq_loop: shows
  ∃! e. e∈G ∧ (∀ x∈G. e·x = x ∧ x·e = x)
proof
  from ex_ident show ∃ e. e ∈ G ∧ (∀ x∈G. e · x = x ∧ x · e = x) by auto
next
  fix e y
  assume e ∈ G ∧ (∀ x∈G. e · x = x ∧ x · e = x) y ∈ G ∧ (∀ x∈G. y · x
= x ∧ x · y = x)
  then have e·y =y and e·y = e by auto
  thus e=y by simp
qed
```

The neutral element as defined in the `loop0` locale is indeed neutral.

```

```

end

25 Ordered loops

theory OrderedLoop_ZF **imports** Loop_ZF Order_ZF

begin

This theory file is about properties of loops (the algebraic structures introduced in IsarMathLib in the Loop_ZF theory) with an additional order relation that is in a way compatible with the loop's binary operation. The oldest reference I have found on the subject is [6].

25.1 Definition and notation

An ordered loop (G, A) is a loop with a partial order relation r that is "translation invariant" with respect to the loop operation A .

A triple (G, A, r) is an ordered loop if (G, A) is a loop and r is a relation on G (i.e. a subset of $G \times G$ with is a partial order and for all elements $x, y, z \in G$ the condition $\langle x, y \rangle \in r$ is equivalent to both $\langle A\langle x, z \rangle, A\langle x, z \rangle \rangle \in r$ and $\langle A\langle z, x \rangle, A\langle z, x \rangle \rangle \in r$. This looks a bit awkward in the basic set theory notation, but using the additive notation for the group operation and $x \leq y$ to instead of $\langle x, y \rangle \in r$ this just means that $x \leq y$ if and only if $x + z \leq y + z$ and $x \leq y$ if and only if $z + x \leq z + y$.

definition

$\text{IsAnOrdLoop}(L, A, r) \equiv$
 $\text{IsALoop}(L, A) \wedge r \subseteq L \times L \wedge \text{IsPartOrder}(L, r) \wedge (\forall x \in L. \forall y \in L. \forall z \in L.$
 $((\langle x, y \rangle \in r \longleftrightarrow \langle A\langle x, z \rangle, A\langle y, z \rangle \rangle \in r) \wedge (\langle x, y \rangle \in r \longleftrightarrow \langle A\langle z, x \rangle, A\langle z, y \rangle \rangle$
 $\in r)))$

We define the set of nonnegative elements in the obvious way as $L^+ = \{x \in L : 0 \leq x\}$.

definition

$\text{Nonnegative}(L, A, r) \equiv \{x \in L. \langle \text{TheNeutralElement}(L, A), x \rangle \in r\}$

The $\text{PositiveSet}(L, A, r)$ is a set similar to $\text{Nonnegative}(L, A, r)$, but without the neutral element.

definition

$\text{PositiveSet}(L, A, r) \equiv$
 $\{x \in L. \langle \text{TheNeutralElement}(L, A), x \rangle \in r \wedge \text{TheNeutralElement}(L, A) \neq x\}$

We will use the additive notation for ordered loops.

26 Semigroups

```
theory Semigroup_ZF imports Partitions_ZF Fold_ZF Enumeration_ZF
```

```
begin
```

It seems that the minimal setup needed to talk about a product of a sequence is a set with a binary operation. Such object is called "magma". However, interesting properties show up when the binary operation is associative and such algebraic structure is called a semigroup. In this theory file we define and study sequences of partial products of sequences of magma and semigroup elements.

26.1 Products of sequences of semigroup elements

Semigroup is a magma in which the binary operation is associative. In this section we mostly study the products of sequences of elements of semigroup. The goal is to establish the fact that taking the product of a sequence is distributive with respect to concatenation of sequences, i.e for two sequences a, b of the semigroup elements we have $\prod(a \sqcup b) = (\prod a) \cdot (\prod b)$, where " $a \sqcup b$ " is concatenation of a and b ($a++b$ in Haskell notation). Less formally, we want to show that we can discard parantheses in expressions of the form $(a_0 \cdot a_1 \cdot \dots \cdot a_n) \cdot (b_0 \cdot \dots \cdot b_k)$.

First we define a notion similar to `Fold`, except that that the initial element of the fold is given by the first element of sequence. By analogy with Haskell fold we call that `Fold1`

definition

```
Fold1(f,a)  $\equiv$  Fold(f,a(0),Tail(a))
```

The definition of the `semigr0` context below introduces notation for writing about finite sequences and semigroup products. In the context we fix the carrier and denote it G . The binary operation on G is called f . All theorems proven in the context `semigr0` will implicitly assume that f is an associative operation on G . We will use multiplicative notation for the semigroup operation. The product of a sequence a is denoted $\prod a$. We will write $a \leftarrow x$ for the result of appending an element x to the finite sequence (list) a . This is a bit nonstandard, but I don't have a better idea for the "append" notation. Finally, $a \sqcup b$ will denote the concatenation of the lists a and b .

`locale semigr0 =`

```

fixes G f

assumes assoc_assum: f {is associative on} G

fixes prod (infixl · 72)
defines prod_def [simp]: x · y  $\equiv$  f(x,y)

fixes seqprod ( $\prod$  _ 71)
defines seqprod_def [simp]:  $\prod$  a  $\equiv$  Fold1(f,a)

fixes append (infix  $\leftarrow$  72)
defines append_def [simp]: a  $\leftarrow$  x  $\equiv$  Append(a,x)

fixes concat (infixl  $\sqcup$  69)
defines concat_def [simp]: a  $\sqcup$  b  $\equiv$  Concat(a,b)

```

The next lemma shows our assumption on the associativity of the semigroup operation in the notation defined in in the `semigr0` context.

```

26.2 Products over sets of indices

In this section we study the properties of expressions of the form $\prod_{i \in \Lambda} a_i = a_{i_0} \cdot a_{i_1} \cdot \dots \cdot a_{i_{n-1}}$, i.e. what we denote as $\prod(\Lambda, a)$. Λ here is a finite subset of some set X and a is a function defined on X with values in the semigroup G .

Suppose $a : X \rightarrow G$ is an indexed family of elements of a semigroup G and $\Lambda = \{i_0, i_1, \dots, i_{n-1}\} \subseteq \mathbb{N}$ is a finite set of indices. We want to define $\prod_{i \in \Lambda} a_i = a_{i_0} \cdot a_{i_1} \cdot \dots \cdot a_{i_{n-1}}$. To do that we use the notion of **Enumeration**

defined in the `Enumeration_ZF` theory file that takes a set of indices and lists them in increasing order, thus converting it to list. Then we use the `Fold1` to multiply the resulting list. Recall that in Isabelle/ZF the capital letter "O" denotes the composition of two functions (or relations).

definition

```
SetFold(f,a,Λ,r) = Fold1(f,a 0 Enumeration(Λ,r))
```

For a finite subset Λ of a linearly ordered set X we will write $\sigma(\Lambda)$ to denote the enumeration of the elements of Λ , i.e. the only order isomorphism $|\Lambda| \rightarrow \Lambda$, where $|\Lambda| \in \mathbb{N}$ is the number of elements of Λ . We also define notation for taking a product over a set of indices of some sequence of semigroup elements. The product of semigroup elements over some set $\Lambda \subseteq X$ of indices of a sequence $a : X \rightarrow G$ (i.e. $\prod_{i \in \Lambda} a_i$) is denoted $\prod(\Lambda, a)$. In the `semigr1` context we assume that a is a function defined on some linearly ordered set X with values in the semigroup G .

```
locale semigr1 = semigr0 +
```

```

  fixes X r
  assumes linord: IsLinOrder(X,r)

  fixes a
  assumes a_is_fun: a : X → G

26.3 Commutative semigroups

Commutative semigroups are those whose operation is commutative, i.e. $a \cdot b = b \cdot a$. This implies that for any permutation $s : n \rightarrow n$ we have $\prod_{j=0}^n a_j = \prod_{j=0}^n a_{s(j)}$, or, closer to the notation we are using in the `semigr0` context, $\prod a = \prod(a \circ s)$. Maybe one day we will be able to prove this, but for now the goal is to prove something simpler: that if the semigroup operation is commutative taking the product of a sequence is distributive with respect to the operation: $\prod_{j=0}^n (a_j \cdot b_j) = \left(\prod_{j=0}^n a_j \right) \left(\prod_{j=0}^n b_j \right)$. Many of the rearrangements (namely those that don't use the inverse) proven in

the AbelianGroup_ZF theory hold in fact in semigroups. Some of them will be reproven in this section.

A rearrangement with 3 elements.

```
lemma (in semigr0) rearr3elems:
  assumes f {is commutative on} G and a∈G b∈G c∈G
  shows a·b·c = a·c·b
  using assms semigr_assoc IsCommutative_def by simp
```

A rearrangement of four elements.

```

The definition of the product $\prod (A, a) \equiv \text{SetFold}(f, a, A, r)$ of a some (finite) set of semigroup elements requires that r is a linear order on the set of indices A . This is necessary so that we know in which order we are multiplying the elements. The product over A is defined so that we have $\prod_A a = \prod a \circ \sigma(A)$ where $\sigma : |A| \rightarrow A$ is the enumeration of A (the only order isomorphism between the number of elements in A and A), see lemma `setproddef`. However, if the operation is commutative, the order is irrelevant. The next theorem formalizes that fact stating that we can replace the enumeration $\sigma(A)$ by any bijection between $|A|$ and A . In a way this is a generalization of `setproddef`. The proof is based on application of `prod_list_of_sets` to the finite collection of singletons that comprise A .

27 Commutative Semigroups

```
theory CommutativeSemigroup_ZF imports Semigroup_ZF
```

```
begin
```

In the `Semigroup` theory we introduced a notion of `SetFold(f, a, Λ, r)` that represents the sum of values of some function a valued in a semigroup where the arguments of that function vary over some set Λ . Using the additive notation something like this would be expressed as $\sum_{x \in \Lambda} f(x)$ in informal mathematics. This theory considers an alternative to that notion that is more specific to commutative semigroups.

27.1 Sum of a function over a set

The r parameter in the definition of `SetFold(f, a, Λ, r)` (from `Semigroup_ZF`) represents a linear order relation on Λ that is needed to indicate in what order we are summing the values $f(x)$. If the semigroup operation is commutative the order does not matter and the relation r is not needed. In this section we define a notion of summing up values of some function $a : X \rightarrow G$ over a finite set of indices $\Gamma \subseteq X$, without using any order relation on X .

We define the sum of values of a function $a : X \rightarrow G$ over a set Λ as the only element of the set of sums of lists that are bijections between the number of values in Λ (which is a natural number $n = \{0, 1, \dots, n-1\}$ if Λ is finite) and Λ . The notion of `Fold1(f, c)` is defined in `Semigroup_ZF` as the fold (sum) of

the list c starting from the first element of that list. The intention is to use the fact that since the result of summing up a list does not depend on the order, the set $\{\text{Fold1}(f, a \ 0 \ b) \mid b \in \text{bij}(|A|, A)\}$ is a singleton and we can extract its only value by taking its union.

definition

$$\text{CommSetFold}(f, a, A) = \bigcup \{\text{Fold1}(f, a \ 0 \ b) \mid b \in \text{bij}(|A|, A)\}$$

the next locale sets up notation for writing about summation in commutative semigroups. We define two kinds of sums. One is the sum of elements of a list (which are just functions defined on a natural number) and the second one represents a more general notion the sum of values of a semigroup valued function over some set of arguments. Since those two types of sums are different notions they are represented by different symbols. However in the presentations they are both intended to be printed as \sum .

locale `commsemigr` =

```

fixes G f

assumes csgassoc: f {is associative on} G

assumes csgcomm: f {is commutative on} G

fixes csgsum (infixl + 69)

fixes X a
assumes csgaisfun: a : X  $\rightarrow$  G

fixes csglistsum ( $\sum$  _ 70)
defines csglistsum_def[simp]:  $\sum$  k  $\equiv$  Fold1(f,k)

fixes csgsetsum ( $\sum$ )
defines csgsetsum_def[simp]:  $\sum$ (A,h)  $\equiv$  CommSetFold(f,h,A)
```

Definition of a sum of function over a set in notation defined in the `commsemigr` locale.

```

lemma (in commsemigr) CommSetFolddef:
  shows ( $\sum$ (A,a)) = ( $\bigcup \{\sum(a \ 0 \ b) \mid b \in \text{bij}(|A|, A)\}$ )
  using CommSetFold_def by simp
```

The next lemma states that the result of a sum does not depend on the order we calculate it. This is similar to lemma `prod_order_irr` in the `Semigroup` theory, except that the `semigr1` locale assumes that the domain of the function we sum up is linearly ordered, while in `commsemigr` we don't have this assumption.

28 Monoids

theory Monoid_ZF imports func_ZF Loop_ZF

begin

This theory provides basic facts about monoids.

28.1 Definition and basic properties

In this section we talk about monoids. The notion of a monoid is similar to the notion of a semigroup except that we require the existence of a neutral element. It is also similar to the notion of group except that we don't require existence of the inverse.

Monoid is a set G with an associative operation and a neutral element. The operation is a function on $G \times G$ with values in G . In the context of ZF set theory this means that it is a set of pairs $\langle x, y \rangle$, where $x \in G \times G$ and $y \in G$. In other words the operation is a certain subset of $(G \times G) \times G$. We express all this by defining a predicate $\text{IsAmonoid}(G, f)$. Here G is the "carrier" of the monoid and f is the binary operation on it.

definition

```

IsAmonoid(G, f) ≡
f {is associative on} G ∧
(∃e ∈ G. (∀ g ∈ G. ( f(⟨e, g⟩) = g) ∧ (f(⟨g, e⟩) = g))))

```

The next locale called "monoid0" defines a context for theorems that concern monoids. In this context we assume that the pair (G, f) is a monoid. We will use the \oplus symbol to denote the monoid operation (for no particular reason).

```

locale monoid0 =
  fixes G f

29 Groups - introduction

theory Group_ZF imports Monoid_ZF

begin

This theory file covers basics of group theory.

29.1 Definition and basic properties of groups

In this section we define the notion of a group and set up the notation for discussing groups. We prove some basic theorems about groups.

To define a group we take a monoid and add a requirement that the right inverse needs to exist for every element of the group.

definition

$$\text{IsAgroup}(G, f) \equiv (\text{IsAmonoid}(G, f) \wedge (\forall g \in G. \exists b \in G. f\langle g, b \rangle = \text{TheNeutralElement}(G, f)))$$

We define the group inverse as the set $\{\langle x, y \rangle \in G \times G : x \cdot y = e\}$, where e is the neutral element of the group. This set (which can be written as $(\cdot)^{-1}\{e\}$) is a certain relation on the group (carrier). Since, as we show later, for every $x \in G$ there is exactly one $y \in G$ such that $x \cdot y = e$ this relation is in fact a function from G to G .

definition

$$\text{GroupInv}(G, f) \equiv \{\langle x, y \rangle \in G \times G. f\langle x, y \rangle = \text{TheNeutralElement}(G, f)\}$$

We will use the multiplicative notation for groups. The neutral element is denoted 1.

locale group0 =

fixes G

fixes P

assumes groupAssum: IsAgroup(G, P)

defines neut_def[simp]: 1 \equiv TheNeutralElement(G, P)

fixes proper (infixl \cdot 70)

defines proper_def[simp]: a \cdot b \equiv P(a, b)

fixes inv ($_^{-1}$ [90] 91)

defines inv_def[simp]: $x^{-1} \equiv \text{GroupInv}(G, P)(x)$

First we show a lemma that says that we can use theorems proven in the monoid0 context (locale).

```
lemma (in group0) group0_2_L1: shows monoid0(G,P)
  using groupAssum IsAgroup_def monoid0_def by simp
```

In some strange cases Isabelle has difficulties with applying the definition of a group. The next lemma defines a rule to be applied in such cases.

```
lemma definition_of_group: assumes IsAmonoid(G,f)
  and  $\forall g \in G. \exists b \in G. f\langle g, b \rangle = \text{TheNeutralElement}(G, f)$ 
  shows IsAgroup(G,f)
  using assms IsAgroup_def by simp
```

A technical lemma that allows to use 1 as the neutral element of the group without referencing a list of lemmas and definitions.

```
lemma (in group0) group0_2_L2:
  shows  $1 \in G \wedge (\forall g \in G. (1 \cdot g = g \wedge g \cdot 1 = g))$ 
  using group0_2_L1 monoid0.unit_is_neutral by simp
```

The group is closed under the group operation. Used all the time, useful to have handy.

```
lemma (in group0) group_op_closed: assumes  $a \in G \quad b \in G$ 
  shows  $a \cdot b \in G$  using assms group0_2_L1 monoid0.group0_1_L1
  by simp
```

The group operation is associative. This is another technical lemma that allows to shorten the list of referenced lemmas in some proofs.

```
lemma (in group0) group_oper_assoc:
  assumes  $a \in G \quad b \in G \quad c \in G$  shows  $a \cdot (b \cdot c) = a \cdot b \cdot c$ 
  using groupAssum assms IsAgroup_def IsAmonoid_def
  IsAssociative_def group_op_closed by simp
```

The group operation maps $G \times G$ into G . It is convenient to have this fact easily accessible in the group0 context.

```
lemma (in group0) group_oper_fun: shows  $P : G \times G \rightarrow G$ 
  using groupAssum IsAgroup_def IsAmonoid_def IsAssociative_def
  by simp
```

The definition of a group requires the existence of the right inverse. We show that this is also the left inverse.

```
theorem (in group0) group0_2_T1:
  assumes A1:  $g \in G$  and A2:  $b \in G$  and A3:  $g \cdot b = 1$ 
  shows  $b \cdot g = 1$

29.2 Subgroups

There are two common ways to define subgroups. One requires that the group operation is closed in the subgroup. The second one defines subgroup as a subset of a group which is itself a group under the group operations. We use the second approach because it results in shorter definition.

The rest of this section is devoted to proving the equivalence of these two definitions of the notion of a subgroup.

A pair (H, P) is a subgroup if H forms a group with the operation P restricted to $H \times H$. It may be surprising that we don't require H to be a subset of G . This however can be inferred from the definition if the pair (G, P) is a group, see lemma group0_3_L2.

definition

$\text{IsAsubgroup}(H, P) \equiv \text{IsAgroup}(H, \text{restrict}(P, H \times H))$

Formally the group operation in a subgroup is different than in the group as they have different domains. Of course we want to use the original operation

with the associated notation in the subgroup. The next couple of lemmas will allow for that.

The next lemma states that the neutral element of a subgroup is in the subgroup and it is both right and left neutral there. The notation is very ugly because we don't want to introduce a separate notation for the subgroup operation.

```

lemma group0_3_L1:
  assumes A1: IsAsubgroup(H,f)
  and A2: n = TheNeutralElement(H,restrict(f,H×H))
  shows n ∈ H
  ∀h∈H. restrict(f,H×H)⟨n,h⟩ = h

theory Group_ZF_1 imports Group_ZF

begin

In this theory we consider right and left translations and odd functions.

30.1 Translations

In this section we consider translations. Translations are maps $T : G \rightarrow G$ of the form $T_g(a) = g \cdot a$ or $T_g(a) = a \cdot g$. We also consider two-dimensional translations $T_g : G \times G \rightarrow G \times G$, where $T_g(a, b) = (a \cdot g, b \cdot g)$ or $T_g(a, b) = (g \cdot a, g \cdot b)$.

For an element $a \in G$ the right translation is defined a function (set of pairs) such that its value (the second element of a pair) is the value of the group operation on the first element of the pair and g . This looks a bit strange in the raw set notation, when we write a function explicitly as a set of pairs and value of the group operation on the pair $\langle a, b \rangle$ as $P\langle a, b \rangle$ instead of the usual infix $a \cdot b$ or $a + b$.

definition

$\text{RightTranslation}(G,P,g) \equiv \{\langle a,b \rangle \in G \times G. P\langle a,g \rangle = b\}$

A similar definition of the left translation.

definition

$\text{LeftTranslation}(G,P,g) \equiv \{\langle a,b \rangle \in G \times G. P\langle g,a \rangle = b\}$

Translations map G into G . Two dimensional translations map $G \times G$ into itself.

lemma (in group0) group0_5_L1: assumes A1: $g \in G$
 shows $\text{RightTranslation}(G,P,g) : G \rightarrow G$ and $\text{LeftTranslation}(G,P,g) : G \rightarrow G$

proof -

from A1 have $\forall a \in G. a \cdot g \in G$ and $\forall a \in G. g \cdot a \in G$

using group_oper_fun apply_funtype by auto

then show

30.2 Odd functions

This section is about odd functions.

Odd functions are those that commute with the group inverse: $f(a^{-1}) = (f(a))^{-1}$.

definition

$$\text{IsOdd}(G, P, f) \equiv (\forall a \in G. f(\text{GroupInv}(G, P)(a)) = \text{GroupInv}(G, P)(f(a)))$$

Let's see the definition of an odd function in a more readable notation.

```

lemma (in group0) group0_6_L1:
  shows IsOdd(G,P,p)  $\longleftrightarrow$  (  $\forall a \in G. p(a^{-1}) = (p(a))^{-1}$  )
  using IsOdd_def by simp

```

We can express the definition of an odd function in two ways.

```

lemma (in group0) group0_6_L2:
  assumes A1: p : G  $\rightarrow$  G
  shows
    ( $\forall a \in G. p(a^{-1}) = (p(a))^{-1}$ )  $\longleftrightarrow$  ( $\forall a \in G. (p(a^{-1}))^{-1} = p(a)$ )
proof
  assume  $\forall a \in G. p(a^{-1}) = (p(a))^{-1}$ 
  with A1 show  $\forall a \in G. (p(a^{-1}))^{-1} = p(a)$ 
    using apply_funtype group_inv_of_inv by simp
next assume A2:  $\forall a \in G. (p(a^{-1}))^{-1} = p(a)$ 
  { fix a assume a  $\in$  G
    with A1 A2 have
       $p(a^{-1}) \in G$  and  $((p(a^{-1}))^{-1})^{-1} = (p(a))^{-1}$ 
      using apply_funtype inverse_in_group by auto
    then have  $p(a^{-1}) = (p(a))^{-1}$ 
      using group_inv_of_inv by simp
  } then show  $\forall a \in G. p(a^{-1}) = (p(a))^{-1}$  by simp
qed

```

30.3 Subgroups and interval arithmetic

The section Binary operations in the func_ZF theory defines the notion of "lifting operation to subsets". In short, every binary operation $f : X \times X \rightarrow X$ on a set X defines an operation on the subsets of X defined by $F(A, B) = \{f(x, y) | x \in A, y \in B\}$. In the group context using multiplicative notation we can write this as $H \cdot K = \{x \cdot y | x \in A, y \in B\}$. Similarly we can define $H^{-1} = \{x^{-1} | x \in H\}$. In this section we study properties of these derived operation and how they relate to the concept of subgroups.

The next locale extends the groups0 locale with notation related to interval arithmetics.

```

locale group4 = group0 +
  fixes sdot (infixl  $\cdot$  70)
  defines sdot_def [simp]: A  $\cdot$  B  $\equiv$  (P {lifted to subsets of} G)(A, B)

  fixes sinv ( $_^{-1}$  [90] 91)
  defines sinv_def [simp]: A $^{-1}$   $\equiv$  GroupInv(G, P)(A)

```

The next lemma shows a somewhat more explicit way of defining the product of two subsets of a group.

```

lemma (in group4) interval_prod: assumes A  $\subseteq$  G B  $\subseteq$  G
  shows A  $\cdot$  B = {x.y.  $\langle x, y \rangle \in A \times B$ }
  using assms group_oper_fun lift_subsets_explained by auto

31 Groups - and alternative definition

```
theory Group_ZF_1b imports Group_ZF
```

```
begin
```

In a typical textbook a group is defined as a set G with an associative operation such that two conditions hold:

A: there is an element $e \in G$ such that for all $g \in G$ we have $e \cdot g = g$ and $g \cdot e = g$. We call this element a "unit" or a "neutral element" of the group.

B: for every $a \in G$ there exists a $b \in G$ such that $a \cdot b = e$, where e is the element of G whose existence is guaranteed by A.

The validity of this definition is rather dubious to me, as condition A does not define any specific element e that can be referred to in condition B - it merely states that a set of such units e is not empty. Of course it does work in the end as we can prove that the set of such neutral elements has exactly one element, but still the definition by itself is not valid. You just can't reference a variable bound by a quantifier outside of the scope of that quantifier.

One way around this is to first use condition A to define the notion of a monoid, then prove the uniqueness of e and then use the condition B to define groups.

Another way is to write conditions A and B together as follows:

$$\exists e \in G (\forall g \in G e \cdot g = g \wedge g \cdot e = g) \wedge (\forall a \in G \exists b \in G a \cdot b = e).$$

This is rather ugly.

What I want to talk about is an amusing way to define groups directly without any reference to the neutral elements. Namely, we can define a group as a non-empty set G with an associative operation "." such that

C: for every $a, b \in G$ the equations $a \cdot x = b$ and $y \cdot a = b$ can be solved in G .

This theory file aims at proving the equivalence of this alternative definition

with the usual definition of the group, as formulated in `Group_ZF.thy`. The informal proofs come from an Aug. 14, 2005 post by buli on the matematyka.org forum.

31.1 An alternative definition of group

First we will define notation for writing about groups.

We will use the multiplicative notation for the group operation. To do this, we define a context (locale) that tells Isabelle to interpret $a \cdot b$ as the value of function P on the pair $\langle a, b \rangle$.

```
locale group2 =
  fixes P
  fixes dot (infixl · 70)
  defines dot_def [simp]: a · b ≡ P⟨a,b⟩
```

The next theorem states that a set G with an associative operation that satisfies condition C is a group, as defined in IsarMathLib `Group_ZF` theory.

```
theorem (in group2) altgroup_is_group:
  assumes A1:  $G \neq 0$  and A2:  $P$  {is associative on}  $G$ 
  and A3:  $\forall a \in G. \forall b \in G. \exists x \in G. a \cdot x = b$ 
  and A4:  $\forall a \in G. \forall b \in G. \exists y \in G. y \cdot a = b$ 
  shows IsAgroup( $G, P$ )
```

proof -

```
  from A1 obtain a where a ∈ G by auto
  with A3 obtain x where x ∈ G and a · x = a
    by auto
```

```
  from A4 ⟨a ∈ G⟩ obtain y where y ∈ G and y · a = a

  by simp
qed

```

The converse of `altgroup_is_group`: in every (classically defined) group condition *C* holds. In informal mathematics we can say "Obviously condition *C* holds in any group." In formalized mathematics the word "obviously" is not in the language. The next theorem is proven in the context called `group0` defined in the theory `Group_ZF.thy`. Similarly to the `group2` that context defines $a \cdot b$ as $P\langle a, b \rangle$. It also defines notation related to the group inverse and adds an assumption that the pair (G, P) is a group to all its theorems. This is why in the next theorem we don't explicitly assume that (G, P) is a group - this assumption is implicit in the context.

```

theorem (in group0) group_is_altgroup: shows
   $\forall a \in G. \forall b \in G. \exists x \in G. a \cdot x = b$  and  $\forall a \in G. \forall b \in G. \exists y \in G. y \cdot a = b$ 
proof -
  { fix a b assume a∈G b∈G
    let x = a-1 · b
    let y = b · a-1
    from ⟨a∈G⟩ ⟨b∈G⟩ have
      x ∈ G y ∈ G and a·x = b y·a = b
      using inverse_in_group group_op_closed inv_cancel_two
      by auto
    hence  $\exists x \in G. a \cdot x = b$  and  $\exists y \in G. y \cdot a = b$  by auto
  } thus
     $\forall a \in G. \forall b \in G. \exists x \in G. a \cdot x = b$  and
     $\forall a \in G. \forall b \in G. \exists y \in G. y \cdot a = b$ 
    by auto
qed
end

```

32 Abelian Group

```
theory AbelianGroup_ZF imports Group_ZF
```

```
begin
```

A group is called "abelian" if its operation is commutative, i.e. $P\langle a, b \rangle = P\langle b, a \rangle$ for all group elements a, b , where P is the group operation. It is

customary to use the additive notation for abelian groups, so this condition is typically written as $a + b = b + a$. We will be using multiplicative notation though (in which the commutativity condition of the operation is written as $a \cdot b = b \cdot a$), just to avoid the hassle of changing the notation we used for general groups.

32.1 Rearrangement formulae

This section is not interesting and should not be read. Here we will prove formulas in which right hand side uses the same factors as the left hand side, just in different order. These facts are obvious in informal math sense, but Isabelle prover is not able to derive them automatically, so we have to prove them by hand.

Proving the facts about associative and commutative operations is quite tedious in formalized mathematics. To a human the thing is simple: we can arrange the elements in any order and put parentheses wherever we want, it is all the same. However, formalizing this statement would be rather difficult (I think). The next lemma attempts a quasi-algorithmic approach to this type of problem. To prove that two expressions are equal, we first strip one from parentheses, then rearrange the elements in proper order, then put the parentheses where we want them to be. The algorithm for rearrangement is easy to describe: we keep putting the first element (from the right) that is in the wrong place at the left-most position until we get the proper arrangement. As far removing parentheses is concerned Isabelle does its job automatically.

```
lemma (in group0) group0_4_L2:
  assumes A1:P {is commutative on} G
  and A2:a∈G b∈G c∈G d∈G E∈G F∈G
  shows (a·b)·(c·d)·(E·F) = (a·(d·F))·(b·(c·E))
proof -
  from A2 have (a·b)·(c·d)·(E·F) = a·b·c·d·E·F
    using group_op_closed group_oper_assoc
    by simp
  also have a·b·c·d·E·F = a·d·F·b·c·E

```

This theory continues Group_ZF.thy and considers lifting the group structure to function spaces and projecting the group structure to quotient spaces, in particular the quotient group.

33.1 Lifting groups to function spaces

If we have a monoid (group) G than we get a monoid (group) structure on a space of functions valued in G by defining $(f \cdot g)(x) := f(x) \cdot g(x)$. We call this process "lifting the monoid (group) to function space". This section formalizes this lifting.

The lifted operation is an operation on the function space.

```

lemma (in monoid0) Group_ZF_2_1_L0A:
  assumes A1: F = f {lifted to function space over} X

33.3 Normal subgroups and quotient groups

If H is a subgroup of G , then for every $a \in G$ we can consider the sets $\{a \cdot h \mid h \in H\}$ and $\{h \cdot a \mid h \in H\}$ (called a left and right "coset of H ", resp.) These sets sometimes form a group, called the "quotient group". This section discusses the notion of quotient groups.

A normal subgroup N of a group G is such that aba^{-1} belongs to N if $a \in G, b \in N$.

definition

$$\text{IsAnormalSubgroup}(G,P,N) \equiv \text{IsASubgroup}(N,P) \wedge$$

$$(\forall n \in N. \forall g \in G. P\langle g \cdot n, \text{GroupInv}(G,P)(g) \rangle \in N)$$

Having a group and a normal subgroup N we can create another group consisting of equivalence classes of the relation $a \sim b \equiv a \cdot b^{-1} \in N$. We will refer to this relation as the quotient group relation. The classes of this relation are in fact cosets of subgroup H .

definition

$$\text{QuotientGroupRel}(G,P,H) \equiv$$

$$\{ \langle a, b \rangle \in G \times G. P\langle a, \text{GroupInv}(G,P)(b) \rangle \in H \}$$

Next we define the operation in the quotient group as the projection of the group operation on the classes of the quotient group relation.

definition

$$\text{QuotientGroupOp}(G,P,H) \equiv \text{ProjFun2}(G, \text{QuotientGroupRel}(G,P,H), P)$$

Definition of a normal subgroup in a more readable notation.

34 Groups 3

theory Group_ZF_3 imports Group_ZF_2 Finite1

begin

In this theory we consider notions in group theory that are useful for the construction of real numbers in the `Real_ZF_x` series of theories.

34.1 Group valued finite range functions

In this section show that the group valued functions $f : X \rightarrow G$, with the property that $f(X)$ is a finite subset of G , is a group. Such functions play an important role in the construction of real numbers in the `Real_ZF` series.

The following proves the essential condition to show that the set of finite range functions is closed with respect to the lifted group operation.

```
lemma (in group0) Group_ZF_3_1_L1:
  assumes A1: F = P {lifted to function space over} X
  and
  A2: s ∈ FinRangeFunctions(X,G)  r ∈ FinRangeFunctions(X,G)
  shows F⟨ s,r⟩ ∈ FinRangeFunctions(X,G)
proof -
  let q = F⟨ s,r⟩
  from A2 have T1:s:X→G r:X→G
    using FinRangeFunctions_def by auto
  with A1 have T2:q : X→G

34.2 Almost homomorphisms

An almost homomorphism is a group valued function defined on a monoid M with the property that the set $\{f(m+n) - f(m) - f(n)\}_{m,n \in M}$ is finite. This term is used by R. D. Arthan in "The Eudoxus Real Numbers". We use this term in the general group context and use the A'Campo's term "slopes" (see his "A natural construction for the real numbers") to mean an almost homomorphism mapping integers into themselves. We consider almost homomorphisms because we use slopes to define real numbers in the `Real_ZF_x` series.

`HomDiff` is an acronym for "homomorphism difference". This is the expression $s(mn)(s(m)s(n))^{-1}$, or $s(m+n) - s(m) - s(n)$ in the additive notation. It is equal to the neutral element of the group if s is a homomorphism.

definition

```

HomDiff(G,f,s,x)  $\equiv$ 
  f(s(f(fst(x),snd(x))),
    (GroupInv(G,f)(f(s(fst(x)),s(snd(x))))))

```

Almost homomorphisms are defined as those maps $s : G \rightarrow G$ such that the homomorphism difference takes only finite number of values on $G \times G$.

definition

```

AlmostHoms(G,f)  $\equiv$ 
  {s  $\in$  G $\rightarrow$ G. {HomDiff(G,f,s,x). x  $\in$  G $\times$ G }  $\in$  Fin(G)}

```

`AlHomOp1`(G, f) is the group operation on almost homomorphisms defined in a natural way by $(s \cdot r)(n) = s(n) \cdot r(n)$. In the terminology defined in `funcl.thy` this is the group operation f (on G) lifted to the function space $G \rightarrow G$ and restricted to the set `AlmostHoms`(G, f).

definition

```

AlHomOp1(G,f)  $\equiv$ 
  restrict(f {lifted to function space over} G,
    AlmostHoms(G,f)  $\times$  AlmostHoms(G,f))

```

We also define a composition (binary) operator on almost homomorphisms in a natural way. We call that operator `AlHomOp2` - the second operation on almost homomorphisms. Composition of almost homomorphisms is used to define multiplication of real numbers in `Real_ZF` series.

definition

```

AlHomOp2(G,f) ≡
restrict(Composition(G),AlmostHoms(G,f)×AlmostHoms(G,f))

```

This lemma provides more readable notation for the HomDiff definition. Not really intended to be used in proofs, but just to see the definition in the notation defined in the group0 locale.

```

lemma (in group0) HomDiff_notation:
  shows HomDiff(G,P,s,< m,n>) = s(m·n)·(s(m)·s(n))-1
  using HomDiff_def by simp

```

The next lemma shows the set from the definition of almost homomorphism in a different form.

```

lemma (in group0) Group_ZF_3_2_L1A: shows
  {HomDiff(G,P,s,x). x ∈ G×G} = {s(m·n)·(s(m)·s(n))-1. < m,n> ∈ G×G}
proof -
  have ∀m∈G.∀n∈G. HomDiff(G,P,s,< m,n>) = s(m·n)·(s(m)·s(n))-1
    using HomDiff_notation by simp
  then show thesis by (rule ZF1_1_L4A)
qed

```

Let's define some notation. We inherit the notation and assumptions from the group0 context (locale) and add some. We will use AH to denote the set of almost homomorphisms. \sim is the inverse (negative if the group is the group of integers) of almost homomorphisms, $(\sim p)(n) = p(n)^{-1}$. δ will denote the homomorphism difference specific for the group $(\text{HomDiff}(G, f))$. The notation $s \approx r$ will mean that s, r are almost equal, that is they are in the equivalence relation defined by the group of finite range functions (that is a normal subgroup of almost homomorphisms, if the group is abelian). We show that this is equivalent to the set $\{s(n) \cdot r(n)^{-1} : n \in G\}$ being finite. We also add an assumption that the G is abelian as many needed properties do not hold without that.

34.4 Compositions of almost homomorphisms

The goal of this section is to establish some facts about composition of almost homomorphisms. needed for the real numbers construction in Real_ZF_x series. In particular we show that the set of almost homomorphisms is closed under composition and that composition is congruent with respect to the equivalence relation defined by the group of finite range functions (a normal subgroup of almost homomorphisms).

The next formula restates the definition of the homomorphism difference to express the value an almost homomorphism on a product.

```

34.5 Shifting almost homomorphisms

In this section we consider what happens if we multiply an almost homomorphism by a group element. We show that the resulting function is also an a. h., and almost equal to the original one. This is used only for slopes (integer a.h.) in Int_ZF_2 where we need to correct a positive slopes by adding a constant, so that it is at least 2 on positive integers.

If s is an almost homomorphism and c is some constant from the group, then $s \cdot c$ is an almost homomorphism.

35 Direct product

theory DirectProduct_ZF **imports** func_ZF

begin

This theory considers the direct product of binary operations. Contributed by Seo Sanghyeon.

35.1 Definition

In group theory the notion of direct product provides a natural way of creating a new group from two given groups.

Given (G, \cdot) and (H, \circ) a new operation $(G \times H, \times)$ is defined as $(g, h) \times (g', h') = (g \cdot g', h \circ h')$.

definition

```

DirectProduct(P,Q,G,H) ≡
  {⟨x, ⟨P⟨fst(fst(x)), fst(snd(x))⟩ , Q⟨snd(fst(x)), snd(snd(x))⟩⟩⟩.
   x ∈ (G×H)×(G×H)}

```

We define a context called `direct0` which holds an assumption that P, Q are binary operations on G, H , resp. and denotes R as the direct product of (G, P) and (H, Q) .

```

locale direct0 =
  fixes P Q G H
  assumes Pfun: P : G×G→G
  assumes Qfun: Q : H×H→H
  fixes R
  defines Rdef [simp]: R ≡ DirectProduct(P,Q,G,H)

```

The direct product of binary operations is a binary operation.

```

lemma (in direct0) DirectProduct_ZF_1_L1:
  shows R : (G×H)×(G×H)→G×H
proof -
  from Pfun Qfun have  $\forall x \in (G \times H) \times (G \times H).$ 
     $\langle P\langle \text{fst}(\text{fst}(x)), \text{fst}(\text{snd}(x)) \rangle, Q\langle \text{snd}(\text{fst}(x)), \text{snd}(\text{snd}(x)) \rangle \rangle \in G \times H$

36 Ordered groups - introduction

```

theory OrderedGroup_ZF imports Group_ZF_1 AbelianGroup_ZF Finite_ZF_1
OrderedLoop_ZF

```

begin

This theory file defines and shows the basic properties of (partially or linearly) ordered groups. We show that in linearly ordered groups finite sets are bounded and provide a sufficient condition for bounded sets to be finite. This allows to show in `Int_ZF_IML.thy` that subsets of integers are bounded iff they are finite. Some theorems proven here are properties of ordered loops rather than groups. However, for now the development is independent from the material in the `OrderedLoop_ZF` theory, we just import the definitions of `NonnegativeSet` and `PositiveSet` from there.

36.1 Ordered groups

This section defines ordered groups and various related notions.

An ordered group is a group equipped with a partial order that is "translation invariant", that is if $a \leq b$ then $a \cdot g \leq b \cdot g$ and $g \cdot a \leq g \cdot b$.

definition

```

IsAnOrdGroup(G,P,r)  $\equiv$ 
(IsAgroup(G,P)  $\wedge$   $r \subseteq G \times G$   $\wedge$  IsPartOrder(G,r)  $\wedge$  ( $\forall g \in G. \forall a \ b. \langle a, b \rangle \in r \longrightarrow \langle P\langle a, g \rangle, P\langle b, g \rangle \rangle \in r \wedge \langle P\langle g, a \rangle, P\langle g, b \rangle \rangle \in r$ ))

```

We also define the absolute value as a ZF-function that is the identity on G^+ and the group inverse on the rest of the group.

definition

```

AbsoluteValue(G,P,r)  $\equiv$  id(Nonnegative(G,P,r))  $\cup$ 
restrict(GroupInv(G,P), G - Nonnegative(G,P,r))

```

The odd functions are defined as those having property $f(a^{-1}) = (f(a))^{-1}$. This looks a bit strange in the multiplicative notation, I have to admit. For linearly ordered groups a function f defined on the set of positive elements

iniquely defines an odd function of the whole group. This function is called an odd extension of f

definition

```
OddExtension(G,P,r,f) ≡
(f ∪ {⟨a, GroupInv(G,P)(f(GroupInv(G,P)(a)))⟩}.
a ∈ GroupInv(G,P)(PositiveSet(G,P,r))} ∪
{⟨TheNeutralElement(G,P),TheNeutralElement(G,P)⟩})
```

We will use a similar notation for ordered groups as for the generic groups. G^+ denotes the set of nonnegative elements (that satisfy $1 \leq a$) and G_+ is the set of (strictly) positive elements. $-A$ is the set inverses of elements from A . I hope that using additive notation for this notion is not too shocking here. The symbol f° denotes the odd extension of f . For a function defined on G_+ this is the unique odd function on G that is equal to f on G_+ .

locale group3 =

fixes G and P and r

assumes ordGroupAssum: IsAnOrdGroup(G,P,r)

fixes unit (1)

defines unit_def [simp]: 1 ≡ TheNeutralElement(G,P)

fixes proper (infixl · 70)

defines proper_def [simp]: a · b ≡ P⟨ a,b⟩

fixes inv ($_^{-1}$ [90] 91)

defines inv_def [simp]: x^{-1} ≡ GroupInv(G,P)(x)

fixes lesseq (infix ≤ 68)

defines lesseq_def [simp]: $a \leq b$ ≡ ⟨ a,b⟩ ∈ r

fixes sless (infix < 68)

defines sless_def [simp]: $a < b$ ≡ $a \leq b \wedge a \neq b$

fixes nonnegative (G^+)

defines nonnegative_def [simp]: G^+ ≡ Nonnegative(G,P,r)

fixes positive (G_+)

defines positive_def [simp]: G_+ ≡ PositiveSet(G,P,r)

fixes setinv (- _ 72)

defines setninv_def [simp]: $-A$ ≡ GroupInv(G,P)(A)

fixes abs (| _ |)

defines abs_def [simp]: $|a|$ ≡ AbsoluteValue(G,P,r)(a)

fixes oddext ($_^\circ$)

```
defines oddext_def [simp]:  $f^\circ \equiv \text{OddExtension}(G,P,r,f)$ 
```

In group3 context we can use the theorems proven in the group0 context.

```
lemma (in group3) OrderedGroup_ZF_1_L1: shows group0(G,P)
  using ordGroupAssum IsAnOrdGroup_def group0_def by simp
```

Ordered group (carrier) is not empty. This is a property of monoids, but it is good to have it handy in the group3 context.

```
lemma (in group3) OrderedGroup_ZF_1_L1A: shows  $G \neq 0$ 
  using OrderedGroup_ZF_1_L1 group0.group0_2_L1 monoid0.group0_1_L3A
  by blast
```

The next lemma is just to see the definition of the nonnegative set in our notation.

```
lemma (in group3) OrderedGroup_ZF_1_L2:
  shows  $g \in G^+ \iff 1 \leq g$ 
  using ordGroupAssum IsAnOrdGroup_def Nonnegative_def
  by auto
```

The next lemma is just to see the definition of the positive set in our notation.

```
lemma (in group3) OrderedGroup_ZF_1_L2A:
  shows  $g \in G_+ \iff (1 \leq g \wedge g \neq 1)$ 
  using ordGroupAssum IsAnOrdGroup_def PositiveSet_def
  by auto
```

For total order if g is not in G^+ , then it has to be less or equal the unit.

```
lemma (in group3) OrderedGroup_ZF_1_L2B:
  assumes A1:  $r \text{ \{is total on\} } G$  and A2:  $a \in G - G^+$ 
  shows  $a \leq 1$ 
proof -
  from A2 have  $a \in G \quad 1 \in G \quad \neg(1 \leq a)$ 
  using OrderedGroup_ZF_1_L1 group0.group0_2_L2 OrderedGroup_ZF_1_L2
  by auto
  with A1 show thesis using IsTotal_def by auto
qed
```

The group order is reflexive.

```
lemma (in group3) OrderedGroup_ZF_1_L3: assumes  $g \in G$ 
  shows  $g \leq g$ 
  using ordGroupAssum assms IsAnOrdGroup_def IsPartOrder_def refl_def
  by simp
```

1 is nonnegative.

```
lemma (in group3) OrderedGroup_ZF_1_L3A: shows  $1 \in G^+$ 
  using OrderedGroup_ZF_1_L2 OrderedGroup_ZF_1_L3
  OrderedGroup_ZF_1_L1 group0.group0_2_L2 by simp
```

In this context $a \leq b$ implies that both a and b belong to G .

```
lemma (in group3) OrderedGroup_ZF_1_L4:
  assumes a≤b shows a∈G b∈G
  using ordGroupAssum assms IsAnOrdGroup_def by auto
```

Similarly in this context $a \leq b$ implies that both a and b belong to G .

```
lemma (in group3) less_are_members:
  assumes a<b shows a∈G b∈G
  using ordGroupAssum assms IsAnOrdGroup_def by auto
```

It is good to have transitivity handy.

```
lemma (in group3) Group_order_transitive:
  assumes A1: a≤b b≤c shows a≤c
proof -
  from ordGroupAssum have trans(r)
    using IsAnOrdGroup_def IsPartOrder_def
    by simp
  moreover from A1 have ⟨ a,b ⟩ ∈ r ∧ ⟨ b,c ⟩ ∈ r by simp
  ultimately have ⟨ a,c ⟩ ∈ r by (rule Fol1_L3)
  thus thesis by simp
qed
```

The order in an ordered group is antisymmetric.

```
lemma (in group3) group_order_antisym:
  assumes A1: a≤b b≤a shows a=b
proof -
  from ordGroupAssum A1 have
    antisym(r) ⟨ a,b ⟩ ∈ r ⟨ b,a ⟩ ∈ r
    using IsAnOrdGroup_def IsPartOrder_def by auto
  then show a=b by (rule Fol1_L4)
qed
```

Transitivity for the strict order: if $a < b$ and $b \leq c$, then $a < c$.

```

36.3 The set of positive elements

In this section we study G_+ - the set of elements that are (strictly) greater than the unit. The most important result is that every linearly ordered group can be decomposed into $\{1\}$, G_+ and the set of those elements $a \in G$ such that $a^{-1} \in G_+$. Another property of linearly ordered groups that we prove here is that if $G_+ \neq \emptyset$, then it is infinite. This allows to show that nontrivial linearly ordered groups are infinite.

The positive set is closed under the group operation.

```

lemma (in group3) OrderedGroup_ZF_1_L13: shows  $G_+$  {is closed under}
P
proof -
  { fix a b assume  $a \in G_+$   $b \in G_+$

In this theory we continue the OrderedGroup_ZF theory development.

37.1 Absolute value and the triangle inequality

The goal of this section is to prove the triangle inequality for ordered groups.

Absolute value maps G into G .

```
lemma (in group3) OrderedGroup_ZF_3_L1:
  shows AbsoluteValue(G,P,r) : G→G
proof -
  let f = id(G+)
  let g = restrict(GroupInv(G,P),G-G+)
  have f : G+→G+ using id_type by simp
  then have f : G+→G using OrderedGroup_ZF_1_L4E fun_weaken_type
    by blast
  moreover have g : G-G+→G
proof -
  from ordGroupAssum have GroupInv(G,P) : G→G
    using IsAnOrdGroup_def group0_2_T2 by simp
  moreover have G-G+ ⊆ G by auto
  ultimately show thesis using restrict_type2 by simp
qed
moreover have G+∩(G-G+) = 0 by blast
ultimately have f ∪ g : G+∪(G-G+)→GUG
  by (rule fun_disjoint_Un)
moreover have G+∪(G-G+) = G using OrderedGroup_ZF_1_L4E
  by auto
ultimately show AbsoluteValue(G,P,r) : G→G
  using AbsoluteValue_def by simp
qed
```

If $a \in G^+$, then $|a| = a$.

```
lemma (in group3) OrderedGroup_ZF_3_L2:
  assumes A1: a∈G+ shows |a| = a
proof -
  from ordGroupAssum have GroupInv(G,P) : G→G
    using IsAnOrdGroup_def group0_2_T2 by simp
  with A1 show thesis using
    func1_1_L1 OrderedGroup_ZF_1_L4E fun_disjoint_apply1
    AbsoluteValue_def id_conv by simp
qed
```

The absolute value of the unit is the unit. In the additive totation that would be $|0| = 0$.

```
lemma (in group3) OrderedGroup_ZF_3_L2A:
  shows |1| = 1 using OrderedGroup_ZF_1_L3A OrderedGroup_ZF_3_L2
  by simp
```

If a is positive, then $|a| = a$.

37.2 Maximum absolute value of a set

Quite often when considering inequalities we prefer to talk about the absolute values instead of raw elements of a set. This section formalizes some material that is useful for that.

If a set has a maximum and minimum, then the greater of the absolute value of the maximum and minimum belongs to the image of the set by the absolute value function.

```

lemma (in group3) OrderedGroup_ZF_4_L1:
  assumes  $A \subseteq G$ 
  and HasAmaximum(r,A) HasAminimum(r,A)
  and  $M = \text{GreaterOf}(r, |\text{Minimum}(r,A)|, |\text{Maximum}(r,A)|)$ 
  shows  $M \in \text{AbsoluteValue}(G, P, r)(A)$

37.3 Alternative definitions

Sometimes it is useful to define the order by prescribing the set of positive or nonnegative elements. This section deals with two such definitions. One takes a subset H of G that is closed under the group operation, $1 \notin H$ and for every $a \in H$ we have either $a \in H$ or $a^{-1} \in H$. Then the order is defined

as $a \leq b$ iff $a = b$ or $a^{-1}b \in H$. For abelian groups this makes a linearly ordered group. We will refer to order defined this way in the comments as the order defined by a positive set. The context used in this section is the `group0` context defined in `Group_ZF` theory. Recall that `f` in that context denotes the group operation (unlike in the previous sections where the group operation was denoted `P`).

The order defined by a positive set is the same as the order defined by a nonnegative set.

```
lemma (in group0) OrderedGroup_ZF_5_L1:
  assumes A1: r = {p ∈ G×G. fst(p) = snd(p) ∨ fst(p)-1.snd(p) ∈ H}
  shows ⟨a,b⟩ ∈ r ⟷ a∈G ∧ b∈G ∧ a-1.b ∈ H ∪ {1}

```

OrderFromPosSet(G,P,H) ≡
  {p ∈ G×G. fst(p) = snd(p) ∨ P⟨GroupInv(G,P)(fst(p)),snd(p)⟩ ∈ H }

```

The next theorem rephrases lemmas `OrderedGroup_ZF_5_L5` and `OrderedGroup_ZF_5_L6` using the definition of the order from the positive set `OrderFromPosSet`. To summarize, this is what it says: Suppose that $H \subseteq G$ is a set closed under that group operation such that $1 \notin H$ and for every nonunit group element a either $a \in H$ or $a^{-1} \in H$. Define the order as $a \leq b$ iff $a = b$ or $a^{-1} \cdot b \in H$. Then this order makes G into a linearly ordered group such H is the set of positive elements (and then of course $H \cup \{1\}$ is the set of nonnegative elements).

```
theorem (in group0) Group_ord_by_positive_set:

37.4 Odd Extensions

In this section we verify properties of odd extensions of functions defined on G_+ . An odd extension of a function $f : G_+ \rightarrow G$ is a function $f^\circ : G \rightarrow G$ defined by $f^\circ(x) = f(x)$ if $x \in G_+$, $f(1) = 1$ and $f^\circ(x) = (f(x^{-1}))^{-1}$ for $x < 1$. Such function is the unique odd function that is equal to f when restricted to G_+ .

The next lemma is just to see the definition of the odd extension in the notation used in the `group1` context.

```
lemma (in group3) OrderedGroup_ZF_6_L1:
  shows f° = f ∪ {⟨a, (f(a-1))-1⟩. a ∈ -G+} ∪ {⟨1,1⟩}
  using OddExtension_def by simp
```

A technical lemma that states that from a function defined on G_+ with values in G we have $(f(a^{-1}))^{-1} \in G$.

```
lemma (in group3) OrderedGroup_ZF_6_L2:
  assumes f: G+→G and a∈-G+
  shows
    f(a-1) ∈ G
    (f(a-1))-1 ∈ G
  using assms OrderedGroup_ZF_1_L27 apply_funtype
    OrderedGroup_ZF_1_L1 group0.inverse_in_group

37.5 Functions with infinite limits

In this section we consider functions $f : G \rightarrow G$ with the property that for $f(x)$ is arbitrarily large for large enough x . More precisely, for every $a \in G$ there exist $b \in G_+$ such that for every $x \geq b$ we have $f(x) \geq a$. In a sense this means that $\lim_{x \rightarrow \infty} f(x) = \infty$, hence the title of this section. We also prove dual statements for functions such that $\lim_{x \rightarrow -\infty} f(x) = -\infty$.

If an image of a set by a function with infinite positive limit is bounded above, then the set itself is bounded above.

```

38 Rings - introduction

```
theory Ring_ZF imports AbelianGroup_ZF
```

```
begin
```

This theory file covers basic facts about rings.

38.1 Definition and basic properties

In this section we define what is a ring and list the basic properties of rings.

We say that three sets (R, A, M) form a ring if (R, A) is an abelian group, (R, M) is a monoid and A is distributive with respect to M on R . A represents the additive operation on R . As such it is a subset of $(R \times R) \times R$ (recall that in ZF set theory functions are sets). Similarly M represents the multiplicative operation on R and is also a subset of $(R \times R) \times R$. We don't require the multiplicative operation to be commutative in the definition of a ring.

definition

```
IsAring(R,A,M)  $\equiv$  IsAgroup(R,A)  $\wedge$  (A {is commutative on} R)  $\wedge$ 
IsAmonoid(R,M)  $\wedge$  IsDistributive(R,A,M)
```

We also define the notion of having no zero divisors. In standard notation the ring has no zero divisors if for all $a, b \in R$ we have $a \cdot b = 0$ implies $a = 0$ or $b = 0$.

definition

```
HasNoZeroDivs(R,A,M)  $\equiv$  ( $\forall a \in R. \forall b \in R.$ 
 $M(a,b) = \text{TheNeutralElement}(R,A) \longrightarrow$ 
 $a = \text{TheNeutralElement}(R,A) \vee b = \text{TheNeutralElement}(R,A)$ )
```

Next we define a locale that will be used when considering rings.

```
locale ring0 =
```

```
  fixes R and A and M
```

```
  assumes ringAssum: IsAring(R,A,M)
```

```
  fixes ringa (infixl + 90)
```

```
  defines ringa_def [simp]:  $a+b \equiv A(a,b)$ 
```

```
  fixes ringminus (- _ 89)

38.2 Rearrangement lemmas

It happens quite often that we want to show a fact like $(a + b)c + d = (ac + d - e) + (bc + e)$ in rings. This is trivial in romantic math and probably there is a way to make it trivial in formalized math. However, I don't know any other way than to tediously prove each such rearrangement when it is needed. This section collects facts of this type.

Rearrangements with two elements of a ring.

lemma (in ring0) Ring_ZF_2_L1: assumes $a \in R$ $b \in R$

shows $a + b \cdot a = (b + 1) \cdot a$

using assms Ring_ZF_1_L2 ring_oper_distr Ring_ZF_1_L3 Ring_ZF_1_L4

by simp

Rearrangements with two elements and cancelling.

lemma (in ring0) Ring_ZF_2_L1A: assumes $a \in R$ $b \in R$

shows

$a - b + b = a$

$a + b - a = b$

$(-a) + b + a = b$

$(-a) + (b + a) = b$

$a + (b - a) = b$

using assms Ring_ZF_1_L1 group0.inv_cancel_two group0.group0_4_L6A

by auto

In commutative rings $a - (b+1)c = (a-d-c) + (d-bc)$. For unknown reasons we have to use the raw set notation in the proof, otherwise all methods fail.

```

39 More on rings

theory Ring_ZF_1 **imports** Ring_ZF Group_ZF_3

begin

This theory is devoted to the part of ring theory specific the construction of real numbers in the `Real_ZF_x` series of theories. The goal is to show that classes of almost homomorphisms form a ring.

39.1 The ring of classes of almost homomorphisms

Almost homomorphisms do not form a ring as the regular homomorphisms do because the lifted group operation is not distributive with respect to composition – we have $s \circ (r \cdot q) \neq s \circ r \cdot s \circ q$ in general. However, we do have $s \circ (r \cdot q) \approx s \circ r \cdot s \circ q$ in the sense of the equivalence relation defined by the group of finite range functions (that is a normal subgroup of almost

homomorphisms, if the group is abelian). This allows to define a natural ring structure on the classes of almost homomorphisms.

The next lemma provides a formula useful for proving that two sides of the distributive law equation for almost homomorphisms are almost equal.

```

lemma (in group1) Ring_ZF_1_1_L1:

40 Ordered rings

```

theory OrderedRing_ZF imports Ring_ZF OrderedGroup_ZF_1

```

```

begin

```

In this theory file we consider ordered rings.

40.1 Definition and notation

This section defines ordered rings and sets up appropriate notation.

We define ordered ring as a commutative ring with linear order that is preserved by translations and such that the set of nonnegative elements is closed under multiplication. Note that this definition does not guarantee that there are no zero divisors in the ring.

definition

```

IsAnOrdRing(R,A,M,r)  $\equiv$ 
( IsAring(R,A,M)  $\wedge$  (M {is commutative on} R)  $\wedge$ 
 $r \subseteq R \times R \wedge$  IsLinOrder(R,r)  $\wedge$ 
 $(\forall a \ b. \forall c \in R. \langle a, b \rangle \in r \longrightarrow \langle A\langle a, c \rangle, A\langle b, c \rangle \rangle \in r) \wedge$ 
(Nonnegative(R,A,r) {is closed under} M))

```

The next context (locale) defines notation used for ordered rings. We do that by extending the notation defined in the `ring0` locale and adding some assumptions to make sure we are talking about ordered rings in this context.

```

locale ring1 = ring0 +

  assumes mult_commut: M {is commutative on} R

  fixes r

  assumes ordincl: r  $\subseteq$  R $\times$ R

  assumes linord: IsLinOrder(R,r)

  fixes lesseq (infix  $\leq$  68)
  defines lesseq_def [simp]: a  $\leq$  b  $\equiv$   $\langle a,b \rangle \in r$ 

  fixes sless (infix  $<$  68)
  defines sless_def [simp]: a  $<$  b  $\equiv$  a $\leq$ b  $\wedge$  a $\neq$ b

  assumes ordgroup:  $\forall a\ b. \forall c \in R. a \leq b \longrightarrow a+c \leq b+c$ 

  assumes pos_mult_closed: Nonnegative(R,A,r) {is closed under} M

  fixes abs (| _ |)
  defines abs_def [simp]: |a|  $\equiv$  AbsoluteValue(R,A,r)(a)

  fixes positiveset (R+)
  defines positiveset_def [simp]: R+  $\equiv$  PositiveSet(R,A,r)

```

The next lemma assures us that we are talking about ordered rings in the `ring1` context.

```

lemma (in ring1) OrdRing_ZF_1_L1: shows IsAnOrdRing(R,A,M,r)

40.2 Absolute value for ordered rings

Absolute value is defined for ordered groups as a function that is the identity on the nonnegative set and the negative of the element (the inverse in the multiplicative notation) on the rest. In this section we consider properties of absolute value related to multiplication in ordered rings.

Absolute value of a product is the product of absolute values: the case when both elements of the ring are nonnegative.

```

lemma (in ring1) OrdRing_ZF_2_L1:

41 Cardinal numbers

```
theory Cardinal_ZF imports ZF.CardinalArith func1
```

```
begin
```

This theory file deals with results on cardinal numbers (cardinals). Cardinals are a generalization of the natural numbers, used to measure the cardinality (size) of sets. Contributed by Daniel de la Concepcion.

41.1 Some new ideas on cardinals

All the results of this section are done without assuming the Axiom of Choice. With the Axiom of Choice in play, the proofs become easier and

some of the assumptions may be dropped.

Since General Topology Theory is closely related to Set Theory, it is very interesting to make use of all the possibilities of Set Theory to try to classify homeomorphic topological spaces. These ideas are generally used to prove that two topological spaces are not homeomorphic.

There exist cardinals which are the successor of another cardinal, but; as happens with ordinals, there are cardinals which are limit cardinal.

definition

$$\text{LimitC}(i) \equiv \text{Card}(i) \wedge 0 < i \wedge (\forall y. (y < i \wedge \text{Card}(y)) \longrightarrow \text{csucc}(y) < i)$$

Simple fact used a couple of times in proofs.

41.2 Main result on cardinals (without the Axiom of Choice)

If two sets are strictly injective to an infinite cardinal, then so is its union. For the case of successor cardinal, this theorem is done in the isabelle library in a more general setting; but that theorem is of not use in the case where $\text{LimitC}(Q)$ and it also makes use of the Axiom of Choice. The mentioned theorem is in the theory file `Cardinal_AC.thy`

Note that if Q is finite and different from 1, let's assume $Q = n$, then the union of A and B is not bounded by Q . Counterexample: two disjoint sets of $n - 1$ elements each have a union of $2n - 2$ elements which are more than n .

Note also that if $Q = 1$ then A and B must be empty and the union is then empty too; and Q cannot be 0 because no set is injective and not bijective to 0.

The proof is divided in two parts, first the case when both sets A and B are finite; and second, the part when at least one of them is infinite. In the first part, it is used the fact that a finite union of finite sets is finite. In the second part it is used the linear order on cardinals (ordinals). This proof can not be generalized to a setting with an infinite union easily.

```

41.3 Choice axioms

We want to prove some theorems assuming that some version of the Axiom of Choice holds. To avoid introducing it as an axiom we will define an appropriate predicate and put that in the assumptions of the theorems. That way technically we stay inside ZF.

The first predicate we define states that the axiom of Q -choice holds for subsets of K if we can find a choice function for every family of subsets of K whose (that family's) cardinality does not exceed Q .

definition

```

AxiomCardinalChoice ({the axiom of}_ {choice holds for subsets}_) where
{the axiom of}  $Q$  {choice holds for subsets}  $K \equiv \text{Card}(Q) \wedge (\forall M N. (M \lesssim Q \wedge (\forall t \in M. N_t \neq 0 \wedge N_t \subseteq K)) \longrightarrow (\exists f. f: \text{Pi}(M, \lambda t. N_t) \wedge (\forall t \in M. f t \in N_t)))$ 

```

Next we define a general form of Q choice where we don't require a collection of files to be included in a file.

definition

```

AxiomCardinalChoiceGen ({the axiom of}_ {choice holds}) where
{the axiom of}  $Q$  {choice holds}  $\equiv \text{Card}(Q) \wedge (\forall M N. (M \lesssim Q \wedge (\forall t \in M. N_t \neq 0)) \longrightarrow (\exists f. f: \text{Pi}(M, \lambda t. N_t) \wedge (\forall t \in M. f t \in N_t)))$ 

```

The axiom of finite choice always holds.

theorem finite_choice:

```

lemma(in group0) whole_normal_subgroup:
  shows IsAnormalSubgroup(G,P,G)
  unfolding IsAnormalSubgroup_def
  using group_op_closed inverse_in_group
  using group0_2_L2 group0_3_T3[of G] unfolding IsOpClosed_def
  by auto
```

Since the whole group and the trivial subgroup are normal, it is natural to define simplicity of groups in the following way:

definition

```
IsSimple ([_,_]{is a simple group} 89)
  where [G,f]{is a simple group}  $\equiv$  IsAgroup(G,f) $\wedge$ ( $\forall M$ . IsAnormalSubgroup(G,f,M)
 $\longrightarrow$  M=G $\vee$ M={TheNeutralElement(G,f)})
```

From the definition follows that if a group has no subgroups, then it is simple.

corollary (in group0) noSubgroup_imp_simple:

```
assumes  $\forall H$ . IsASubgroup(H,P) $\longrightarrow$  H=G $\vee$ H={1}
shows [G,P]{is a simple group}
```

proof-

```
have IsAgroup(G,P) using groupAssum. moreover
{
  fix M assume IsAnormalSubgroup(G,P,M)
  then have IsASubgroup(M,P) unfolding IsAnormalSubgroup_def by auto
  with assms have M=G $\vee$ M={1} by auto
}
ultimately show thesis unfolding IsSimple_def by auto
```

qed

Since every subgroup is normal in abelian groups, it follows that commutative simple groups do not have subgroups.

corollary (in group0) abelian_simple_noSubgroups:

```
assumes [G,P]{is a simple group} P{is commutative on}G
shows  $\forall H$ . IsASubgroup(H,P) $\longrightarrow$  H=G $\vee$ H={1}
```

proof(safe)

```
fix H assume A:IsASubgroup(H,P)H  $\neq$  {1}
then have IsAnormalSubgroup(G,P,H) using Group_ZF_2_4_L6(1) groupAssum
assms(2)
  by auto
with assms(1) A show H=G unfolding IsSimple_def by auto

```

42.4 Homomorphisms

A homomorphism is a function between groups that preserves group operations.

```

definition
  Homomor ( $\_ \{ \text{is a homomorphism} \} \_ \rightarrow \_$  85)
  where  $\text{IsAgroup}(G, P) \implies \text{IsAgroup}(H, F) \implies \text{Homomor}(f, G, P, H, F) \equiv \forall g1 \in G . \forall g2 \in G . f(P\langle g1, g2 \rangle) = F\langle fg1, fg2 \rangle$ 

```

Now a lemma about the definition:

```

lemma homomor_eq:
  assumes  $\text{IsAgroup}(G, P) \text{ IsAgroup}(H, F) \text{ Homomor}(f, G, P, H, F) \ g1 \in G \ g2 \in G$ 
  shows  $f(P\langle g1, g2 \rangle) = F\langle fg1, fg2 \rangle$ 
  using assms Homomor_def by auto

```

An endomorphism is a homomorphism from a group to the same group. In case the group is abelian, it has a nice structure.

```

definition
  End
  where  $\text{End}(G, P) \equiv \{f : G \rightarrow G . \text{Homomor}(f, G, P, G, P)\}$ 

```

The set of endomorphisms forms a submonoid of the monoid of function from a set to that set under composition.

```

lemma(in group0) end_composition:
  assumes  $f1 \in \text{End}(G, P) \ f2 \in \text{End}(G, P)$ 
  shows  $\text{Composition}(G)(f1, f2) \in \text{End}(G, P)$ 
proof-

43 Fields - introduction

theory Field_ZF imports Ring_ZF

begin

This theory covers basic facts about fields.

43.1 Definition and basic properties

In this section we define what is a field and list the basic properties of fields.

Field is a nontrivial commutative ring such that all non-zero elements have an inverse. We define the notion of being a field as a statement about three sets. The first set, denoted K is the carrier of the field. The second set, denoted A represents the additive operation on K (recall that in ZF set theory functions are sets). The third set M represents the multiplicative operation on K .

definition

```
IsAfield(K,A,M) ≡
(IsARing(K,A,M) ∧ (M {is commutative on} K) ∧
TheNeutralElement(K,A) ≠ TheNeutralElement(K,M) ∧
(∀ a∈K. a≠TheNeutralElement(K,A) →
(∃ b∈K. M⟨a,b⟩ = TheNeutralElement(K,M))))
```

The `field0` context extends the `ring0` context adding field-related assumptions and notation related to the multiplicative inverse.

```
locale field0 = ring0 K A M for K A M +
  assumes mult_commute: M {is commutative on} K

  assumes not_triv: 0 ≠ 1

  assumes inv_exists: ∀ a∈K. a≠0 → (∃ b∈K. a·b = 1)

  fixes non_zero (K0)
  defines non_zero_def[simp]: K0 ≡ K-⟨0⟩

  fixes inv (_-1 [96] 97)
  defines inv_def[simp]: a-1 ≡ GroupInv(K0, restrict(M, K0 × K0))(a)
```

The next lemma assures us that we are talking fields in the `field0` context.

```
lemma (in field0) Field_ZF_1_L1: shows IsAfield(K,A,M)
  using ringAssum mult_commute not_triv inv_exists IsAfield_def
  by simp
```

We can use theorems proven in the `field0` context whenever we talk about a field.

     $f(a, \text{GroupInv}(K_0, f)(a)) = \text{TheNeutralElement}(K_0, f) \wedge$ 
     $f(\text{GroupInv}(K_0, f)(a), a) = \text{TheNeutralElement}(K_0, f)$ 
    by (rule group0.group0_2_L6)
  with A1 show  $a \cdot a^{-1} = 1 \ a^{-1} \cdot a = 1$ 
    using Field_ZF_1_L5 Field_ZF_1_L4 by auto
qed

```

A lemma with two field elements and cancelling.

```

lemma (in field0) Field_ZF_1_L7: assumes  $a \in K \ b \in K \ b \neq 0$ 
  shows
     $a \cdot b \cdot b^{-1} = a$ 
     $a \cdot b^{-1} \cdot b = a$ 
  using assms Field_ZF_1_L5 Ring_ZF_1_L11 Field_ZF_1_L6 Ring_ZF_1_L3
  by auto

```

43.2 Equations and identities

This section deals with more specialized identities that are true in fields.

$$a/(a^2) = 1/a .$$

```

lemma (in field0) Field_ZF_2_L1: assumes A1:  $a \in K \ a \neq 0$ 

```

```

shows  $a \cdot (a^{-1})^2 = a^{-1}$ 
proof -
  have  $a \cdot (a^{-1})^2 = a \cdot (a^{-1} \cdot a^{-1})$  by simp
  also from A1 have  $\dots = (a \cdot a^{-1}) \cdot a^{-1}$ 
    using Field_ZF_1_L5 Ring_ZF_1_L11
  by simp
  also from A1 have  $\dots = a^{-1}$ 
    using Field_ZF_1_L6 Field_ZF_1_L5 Ring_ZF_1_L3
  by simp
  finally show  $a \cdot (a^{-1})^2 = a^{-1}$  by simp
qed

```

If we multiply two different numbers by a nonzero number, the results will be different.

```

lemma (in field0) Field_ZF_2_L2:
  assumes  $a \in K$   $b \in K$   $c \in K$   $a \neq b$   $c \neq 0$ 
  shows  $a \cdot c^{-1} \neq b \cdot c^{-1}$ 
  using assms field_has_no_zero_divs Field_ZF_1_L5 Ring_ZF_1_L12B
  by simp

```

We can put a nonzero factor on the other side of non-identity (is this the best way to call it?) changing it to the inverse.

```

lemma (in field0) Field_ZF_2_L3:
  assumes A1:  $a \in K$   $b \in K$   $b \neq 0$   $c \in K$  and A2:  $a \cdot b \neq c$ 
  shows  $a \neq c \cdot b^{-1}$ 
proof -
  from A1 A2 have  $a \cdot b \cdot b^{-1} \neq c \cdot b^{-1}$ 
    using Ring_ZF_1_L4 Field_ZF_2_L2 by simp
  with A1 show  $a \neq c \cdot b^{-1}$  using Field_ZF_1_L7
  by simp
qed

```

If the inverse of b is different than a , then the inverse of a is different than b .

```

lemma (in field0) Field_ZF_2_L4:
  assumes  $a \in K$   $a \neq 0$  and  $b^{-1} \neq a$ 
  shows  $a^{-1} \neq b$ 
  using assms Field_ZF_1_L4 group0.group0_2_L11B
  by simp

```

An identity with two field elements, one and an inverse.

```

lemma (in field0) Field_ZF_2_L5:
  assumes  $a \in K$   $b \in K$   $b \neq 0$ 
  shows  $(1 + a \cdot b) \cdot b^{-1} = a + b^{-1}$ 
  using assms Ring_ZF_1_L4 Field_ZF_1_L5 Ring_ZF_1_L2 ring_oper_distr
    Field_ZF_1_L7 Ring_ZF_1_L3 by simp

```

An identity with three field elements, inverse and cancelling.

```

lemma (in field0) Field_ZF_2_L6: assumes A1:  $a \in K$   $b \in K$   $b \neq 0$   $c \in K$ 
  shows  $a \cdot b \cdot (c \cdot b^{-1}) = a \cdot c$ 
proof -
  from A1 have T:  $a \cdot b \in K$   $b^{-1} \in K$ 
    using Ring_ZF_1_L4 Field_ZF_1_L5 by auto
  with mult_commute A1 have  $a \cdot b \cdot (c \cdot b^{-1}) = a \cdot b \cdot (b^{-1} \cdot c)$ 
    using IsCommutative_def by simp
  moreover

43.3 $1/0=0$

In ZF if $f : X \rightarrow Y$ and $x \notin X$ we have $f(x) = \emptyset$. Since \emptyset (the empty set) in ZF is the same as zero of natural numbers we can claim that $1/0 = 0$ in certain sense. In this section we prove a theorem that makes makes it explicit.

The next locale extends the `field0` locale to introduce notation for division operation.

```

locale fieldd = field0 +
  fixes division
  defines division_def[simp]:  $\text{division} \equiv \{\langle p, \text{fst}(p) \cdot \text{snd}(p)^{-1} \rangle. p \in K \times K_0\}$ 

  fixes fdiv (infixl / 95)
  defines fdiv_def[simp]:  $x/y \equiv \text{division} \langle x, y \rangle$ 

```

Division is a function on $K \times K_0$ with values in K .

```

lemma (in fieldd) div_fun: shows  $\text{division} : K \times K_0 \rightarrow K$ 
proof -
  have  $\forall p \in K \times K_0. \text{fst}(p) \cdot \text{snd}(p)^{-1} \in K$ 
  proof
    fix p assume  $p \in K \times K_0$ 
    hence  $\text{fst}(p) \in K$  and  $\text{snd}(p) \in K_0$  by auto
    then show  $\text{fst}(p) \cdot \text{snd}(p)^{-1} \in K$  using Ring_ZF_1_L4 Field_ZF_1_L5 by
  auto
  qed
  then have  $\{\langle p, \text{fst}(p) \cdot \text{snd}(p)^{-1} \rangle. p \in K \times K_0\} : K \times K_0 \rightarrow K$ 
    by (rule ZF_fun_from_total)
  thus thesis by simp
qed

```

So, really $1/0 = 0$. The essential lemma is `apply_0` from standard Isabelle's `func.thy`.

```
theorem (in fieldd) one_over_zero: shows 1/0 = 0

end
```

44 Ordered fields

```
theory OrderedField_ZF imports OrderedRing_ZF Field_ZF

begin
```

This theory covers basic facts about ordered fiels.

44.1 Definition and basic properties

Here we define ordered fields and proove their basic properties.

Ordered field is a notrivial ordered ring such that all non-zero elements have an inverse. We define the notion of being a ordered field as a statement about four sets. The first set, denoted K is the carrier of the field. The second set, denoted A represents the additive operation on K (recall that in ZF set theory functions are sets). The third set M represents the multiplicative operation on K . The fourth set r is the order relation on K .

definition

$$\begin{aligned} \text{IsAnOrdField}(K,A,M,r) \equiv & (\text{IsAnOrdRing}(K,A,M,r) \wedge \\ & (M \text{ \{is commutative on\} } K) \wedge \\ & \text{TheNeutralElement}(K,A) \neq \text{TheNeutralElement}(K,M) \wedge \\ & (\forall a \in K. a \neq \text{TheNeutralElement}(K,A) \longrightarrow \\ & (\exists b \in K. M\langle a,b \rangle = \text{TheNeutralElement}(K,M)))) \end{aligned}$$

The next context (`locale`) defines notation used for ordered fields. We do that by extending the notation defined in the `ring1` context that is used for oredered rings and adding some assumptions to make sure we are talking about ordered fields in this context. We should rename the carrier from R used in the `ring1` context to K , more appropriate for fields. Theoretically the Isar `locale` facility supports such renaming, but we experienced difficulties using some lemmas from `ring1` `locale` after renaming.

```
locale field1 = ring1 +
```

```

assumes mult_commute: M {is commutative on} R

assumes not_triv:  $0 \neq 1$ 

assumes inv_exists:  $\forall a \in R. a \neq 0 \longrightarrow (\exists b \in R. a \cdot b = 1)$ 

fixes non_zero ( $R_0$ )
defines non_zero_def[simp]:  $R_0 \equiv R - \{0\}$ 

fixes inv ( $\_^{-1}$  [96] 97)
defines inv_def[simp]:  $a^{-1} \equiv \text{GroupInv}(R_0, \text{restrict}(M, R_0 \times R_0))(a)$ 

```

The next lemma assures us that we are talking fields in the `field1` context.

```

44.3 Definition of real numbers

The only purpose of this section is to define what does it mean to be a model of real numbers.

We define model of real numbers as any quadruple of sets (K, A, M, r) such that (K, A, M, r) is an ordered field and the order relation r is complete, that is every set that is nonempty and bounded above in this relation has a supremum.

definition

$\text{IsAmodelOfReals}(K, A, M, r) \equiv \text{IsAnOrdField}(K, A, M, r) \wedge (r \text{ \{is complete\}})$

end

45 Integers - introduction

theory Int_ZF_IML **imports** OrderedGroup_ZF_1 Finite_ZF_1 ZF.Int Nat_ZF_IML

begin

This theory file is an interface between the old-style Isabelle (ZF logic) material on integers and the IsarMathLib project. Here we redefine the meta-level operations on integers (addition and multiplication) to convert them to ZF-functions and show that integers form a commutative group with respect to addition and commutative monoid with respect to multiplication. Similarly, we redefine the order on integers as a relation, that is a subset of $Z \times Z$. We show that a subset of intergers is bounded iff it is finite. As we are forced to use standard Isabelle notation with all these dollar signs, sharps etc. to denote "type coercions" (?) the notation is often ugly and difficult to read.

45.1 Addition and multiplication as ZF-functions.

In this section we provide definitions of addition and multiplication as subsets of $(Z \times Z) \times Z$. We use the (higher order) relation defined in the standard

Int theory to define a subset of $Z \times Z$ that constitutes the ZF order relation corresponding to it. We define the set of positive integers using the notion of positive set from the `OrderedGroup_ZF` theory.

Definition of addition of integers as a binary operation on `int`. Recall that in standard Isabelle/ZF `int` is the set of integers and the sum of integers is denoted by prepending `+` with a dollar sign.

definition

```
IntegerAddition  $\equiv$  { < x,c>  $\in$  (int $\times$ int) $\times$ int. fst(x) $+ snd(x) = c }
```

Definition of multiplication of integers as a binary operation on `int`. In standard Isabelle/ZF product of integers is denoted by prepending the dollar sign to `*`.

definition

```
IntegerMultiplication  $\equiv$ 
{ < x,c>  $\in$  (int $\times$ int) $\times$ int. fst(x) $* snd(x) = c }
```

Definition of natural order on integers as a relation on `int`. In the standard Isabelle/ZF the inequality relation on integers is denoted \leq prepended with the dollar sign.

definition

```
IntegerOrder  $\equiv$  {p  $\in$  int $\times$ int. fst(p) $ $\leq$  snd(p)}
```

This defines the set of positive integers.

definition

```
PositiveIntegers  $\equiv$  PositiveSet(int,IntegerAddition,IntegerOrder)
```

`IntegerAddition` and `IntegerMultiplication` are functions on `int \times int`.

lemma `Int_ZF_1_L1: shows`

```
IntegerAddition : int $\times$ int  $\rightarrow$  int
IntegerMultiplication : int $\times$ int  $\rightarrow$  int
```

proof -

have

```
{< x,c>  $\in$  (int $\times$ int) $\times$ int. fst(x) $+ snd(x) = c}  $\in$  int $\times$ int $\rightarrow$ int
{< x,c>  $\in$  (int $\times$ int) $\times$ int. fst(x) $* snd(x) = c}  $\in$  int $\times$ int $\rightarrow$ int
using func1_1_L11A by auto
```

then show `IntegerAddition : int \times int \rightarrow int`

```
IntegerMultiplication : int $\times$ int  $\rightarrow$  int
```

```
using IntegerAddition_def IntegerMultiplication_def by auto
```

qed

The next context (locale) defines notation used for integers. We define `0` to denote the neutral element of addition, `1` as the unit of the multiplicative monoid. We introduce notation `m \leq n` for integers and write `m..n` to denote the integer interval with endpoints in `m` and `n`. `abs(m)` means the absolute value of `m`. This is a function defined in `OrderedGroup` that assigns `x` to itself if `x` is positive and assigns the opposite of `x` if `x` \leq 0. Unfortunately we

cannot use the $|\cdot|$ notation as in the `OrderedGroup` theory as this notation has been hogged by the standard Isabelle's `Int` theory. The notation $-A$ where A is a subset of integers means the set $\{-m : m \in A\}$. The symbol $\max f(f, M)$ denotes the maximum of function f over the set A . We also introduce a similar notation for the minimum.

45.4 Bounded vs. finite subsets of integers

The goal of this section is to establish that a subset of integers is bounded is and only is it is finite. The fact that all finite sets are bounded is already shown for all linearly ordered groups in `OrderedGroups_ZF.thy`. To show the other implication we show that all intervals starting at 0 are finite and then use a result from `OrderedGroups_ZF.thy`.

There are no integers between k and $k + 1$.

```

46.3 Integers as an ordered ring

We already know from Int_ZF that integers with addition form a linearly ordered group. To show that integers form an ordered ring we need the fact that the set of nonnegative integers is closed under multiplication.

We start with the property that a product of nonnegative integers is non-negative. The proof is by induction and the next lemma is the induction step.

```

  using assms Int_ZF_2_T1 group3.oddext_is_odd_alt by simp
```

46.6 Functions with infinite limits

In this section we consider functions (integer sequences) that have infinite limits. An integer function has infinite positive limit if it is arbitrarily large for large enough arguments. Similarly, a function has infinite negative limit if it is arbitrarily small for small enough arguments. The material in this come mostly from the section in `OrderedGroup_ZF.thy` with the same title.

Here we rewrite the theorems from that section in the notation we use for integers and add some results specific for the ordered group of integers.

If an image of a set by a function with infinite positive limit is bounded above, then the set itself is bounded above.

```
lemma (in int0) Int_ZF_1_6_L1: assumes f:  $\mathbb{Z} \rightarrow \mathbb{Z}$  and
   $\forall a \in \mathbb{Z}. \exists b \in \mathbb{Z}_+. \forall x. b \leq x \longrightarrow a \leq f(x)$  and  $A \subseteq \mathbb{Z}$  and
  IsBoundedAbove(f(A), IntegerOrder)
shows IsBoundedAbove(A, IntegerOrder)
using assms int_not_trivial Int_ZF_2_T1 group3.OrderedGroup_ZF_7_L1
by simp
```

If an image of a set defined by separation by a function with infinite positive limit is bounded above, then the set itself is bounded above.

```
lemma (in int0) Int_ZF_1_6_L2: assumes A1:  $X \neq 0$  and A2:  $f: \mathbb{Z} \rightarrow \mathbb{Z}$  and

  A3:  $\forall a \in \mathbb{Z}. \exists b \in \mathbb{Z}_+. \forall x. b \leq x \longrightarrow a \leq f(x)$  and
  A4:  $\forall x \in X. b(x) \in \mathbb{Z} \wedge f(b(x)) \leq U$ 
shows  $\exists u. \forall x \in X. b(x) \leq u$ 
proof -
  let G =  $\mathbb{Z}$ 
  let P = IntegerAddition
  let r = IntegerOrder
  from A1 A2 A3 A4 have
    group3(G, P, r)
    r {is total on} G
     $G \neq \{\text{TheNeutralElement}(G, P)\}$ 
     $X \neq 0$  f:  $G \rightarrow G$ 
     $\forall a \in G. \exists b \in \text{PositiveSet}(G, P, r). \forall y. \langle b, y \rangle \in r \longrightarrow \langle a, f(y) \rangle \in r$ 
     $\forall x \in X. b(x) \in G \wedge \langle f(b(x)), U \rangle \in r$ 
    using int_not_trivial Int_ZF_2_T1 by auto
  then have  $\exists u. \forall x \in X. \langle b(x), u \rangle \in r$  by (rule group3.OrderedGroup_ZF_7_L2)
  thus thesis by simp
qed
```

If an image of a set defined by separation by a integer function with infinite negative limit is bounded below, then the set itself is bounded above. This is dual to Int_ZF_1_6_L2.

```
lemma (in int0) Int_ZF_1_6_L3: assumes A1:  $X \neq 0$  and A2:  $f: \mathbb{Z} \rightarrow \mathbb{Z}$  and

  A3:  $\forall a \in \mathbb{Z}. \exists b \in \mathbb{Z}_+. \forall y. b \leq y \longrightarrow f(-y) \leq a$  and
  A4:  $\forall x \in X. b(x) \in \mathbb{Z} \wedge L \leq f(b(x))$ 
shows  $\exists l. \forall x \in X. l \leq b(x)$ 
proof -
  let G =  $\mathbb{Z}$ 
  let P = IntegerAddition
  let r = IntegerOrder
  from A1 A2 A3 A4 have
```

```

group3(G, P, r)
r {is total on} G

    by (rule group3.OrderedGroup_ZF_7_L4)
  thus thesis by simp
qed

```

If a function is larger than some constant for arguments large enough, then the image of a set that is bounded below is bounded below. This is not true for ordered groups in general, but only for those for which bounded sets are finite. This does not require the function to have infinite limit, but such functions do have this property.

```

46.7 Miscellaneous

In this section we put some technical lemmas needed in various other places that are hard to classify.

Suppose we have an integer expression (a meta-function) F such that $F(p)|p|$ is bounded by a linear function of $|p|$, that is for some integers A, B we have $F(p)|p| \leq A|p| + B$. We show that F is then bounded. The proof is easy, we just divide both sides by $|p|$ and take the limit (just kidding).

```

This theory translates some results from the Isabelle's `IntDiv.thy` theory to the notation used by `IsarMathLib`.

47.1 Quotient and reminder

For any integers m, n , $n > 0$ there are unique integers q, p such that $0 \leq p < n$ and $m = n \cdot q + p$. Number p in this decomposition is usually called $m \bmod n$. Standard Isabelle denotes numbers q, p as $m \text{ zdiv } n$ and $m \text{ zmod } n$, resp., and we will use the same notation.

The next lemma is sometimes called the "quotient-remainder theorem".

```

lemma (in int0) IntDiv_ZF_1_L1: assumes  $m \in \mathbb{Z} \quad n \in \mathbb{Z}$

In this theory file we consider the properties of integers that are needed for the real numbers construction in *Real_ZF* series.

48.1 Slopes

In this section we study basic properties of slopes - the integer almost homomorphisms. The general definition of an almost homomorphism f on a group G written in additive notation requires the set $\{f(m+n) - f(m) - f(n) : m, n \in G\}$ to be finite. In this section we establish a definition that is equivalent for integers: that for all integer m, n we have $|f(m+n) - f(m) - f(n)| \leq L$ for some L .

First we extend the standard notation for integers with notation related to slopes. We define slopes as almost homomorphisms on the additive group of integers. The set of slopes is denoted \mathcal{S} . We also define "positive" slopes as those that take infinite number of positive values on positive integers.

We write $\delta(s, m, n)$ to denote the homomorphism difference of s at m, n (i.e. the expression $s(m + n) - s(m) - s(n)$). We denote $\max\delta(s)$ the maximum absolute value of homomorphism difference of s as m, n range over integers. If s is a slope, then the set of homomorphism differences is finite and this maximum exists. In `Group_ZF_3` we define the equivalence relation on almost homomorphisms using the notion of a quotient group relation and use " \approx " to denote it. As here this symbol seems to be hogged by the standard Isabelle, we will use " \sim " instead " \approx ". We show in this section that $s \sim r$ iff for some L we have $|s(m) - r(m)| \leq L$ for all integer m . The " $+$ " denotes the first operation on almost homomorphisms. For slopes this is addition of functions defined in the natural way. The " \circ " symbol denotes the second operation on almost homomorphisms (see `Group_ZF_3` for definition), defined for the group of integers. In short " \circ " is the composition of slopes. The " $^{-1}$ " symbol acts as an infix operator that assigns the value $\min\{n \in \mathbb{Z}_+ : p \leq f(n)\}$ to a pair (of sets) f and p . In application f represents a function defined on \mathbb{Z}_+ and p is a positive integer. We choose this notation because we use it to construct the right inverse in the ring of classes of slopes and show that this ring is in fact a field. To study the homomorphism difference of the function defined by $p \mapsto f^{-1}(p)$ we introduce the symbol ε defined as $\varepsilon(f, \langle m, n \rangle) = f^{-1}(m + n) - f^{-1}(m) - f^{-1}(n)$. Of course the intention is to use the fact that $\varepsilon(f, \langle m, n \rangle)$ is the homomorphism difference of the function g defined as $g(m) = f^{-1}(m)$. We also define $\gamma(s, m, n)$ as the expression $\delta(f, m, -n) + s(0) - \delta(f, n, -n)$. This is useful because of the identity $f(m - n) = \gamma(m, n) + f(m) - f(n)$ that allows to obtain bounds on the value of a slope at the difference of two integers. For every integer m we introduce notation m^S defined by $m^E(n) = m \cdot n$. The mapping $q \mapsto q^S$ embeds integers into \mathcal{S} preserving the order, (that is, maps positive integers into \mathcal{S}_+).

In `Int_Group_ZF_3.thy` we show that finite range functions valued in an abelian group form a normal subgroup of almost homomorphisms. This allows to define the equivalence relation between almost homomorphisms as the relation resulting from dividing by that normal subgroup. Then we show in `Group_ZF_3_4_L12` that if the difference of f and g has finite range (actually $f(n) \cdot g(n)^{-1}$ as we use multiplicative notation in `Group_ZF_3.thy`), then f and g are equivalent. The next lemma translates that fact into the notation used in `int1` context.

```

```

A necessary condition for two slopes to be almost equal. For slopes the definition postulates the set $\{f(m) - g(m) : m \in \mathbb{Z}\}$ to be finite. This lemma shows that this implies that $|f(m) - g(m)|$ is bounded (by some integer) as m varies over integers. We also mention here that in this context $s \sim r$ implies that both s and r are slopes.

```

Recall that f is a slope iff $f(m+n) - f(m) - f(n)$ is bounded as m, n ranges over integers. The next lemma is the first step in showing that we only need to check this condition as m, n ranges over positive intergers. Namely we show that if the condition holds for positive integers, then it holds if one integer is positive and the second one is nonnegative.

```

48.2 Composing slopes

Composition of slopes is not commutative. However, as we show in this section if f and g are slopes then the range of $f \circ g - g \circ f$ is bounded. This allows to show that the multiplication of real numbers is commutative.

Two useful estimates.

```

49 Integers 3

theory Int_ZF_3 imports Int_ZF_2

begin

This theory is a continuation of Int_ZF_2. We consider here the properties of slopes (almost homomorphisms on integers) that allow to define the order relation and multiplicative inverse on real numbers. We also prove theorems that allow to show completeness of the order relation of real numbers we define in Real_ZF.

49.1 Positive slopes

This section provides background material for defining the order relation on real numbers.

Positive slopes are functions (of course.)

```

```

We know from Group_ZF_3.thy that finite range functions are almost homomorphisms. Besides reminding that fact for slopes the next lemma shows that finite range functions do not belong to S_+ . This is important, because the projection of the set of finite range functions defines zero in the real number construction in Real_ZF_x.thy series, while the projection of S_+ becomes the set of (strictly) positive reals. We don't want zero to be positive, do we? The next lemma is a part of Lemma 5 in the Arthan's paper [2].

```

lemma (in int1) Int_ZF_2_3_L1B:
  assumes A1:  $f \in \text{FinRangeFunctions}(\mathbb{Z}, \mathbb{Z})$ 
  shows  $f \in S \quad f \notin S_+$

49.2 Inverting slopes

Not every slope is a 1:1 function. However, we can still invert slopes in the sense that if f is a slope, then we can find a slope g such that $f \circ g$ is almost equal to the identity function. The goal of this section is to establish this fact for positive slopes.

If f is a positive slope, then for every positive integer p the set $\{n \in \mathbb{Z}_+ : p \leq f(n)\}$ is a nonempty subset of positive integers. Recall that $f^{-1}(p)$ is the notation for the smallest element of this set.

```

Int_ZF_2_4_L12 is almost what we need, except that it has an assumption that the values of the slope that we get the inverse for are not smaller than 2 on positive integers. The Arthan's proof of Theorem 11 has a mistake where he says "note that for all but finitely many $m, n \in N$ $p = g(m)$ and $q = g(n)$ are both positive". Of course there may be infinitely many pairs $\langle m, n \rangle$ such that p, q are not both positive. This is however easy to workaround: we just modify the slope by adding a constant so that the slope is large enough on positive integers and then look for the inverse.

49.3 Completeness

In this section we consider properties of slopes that are needed for the proof of completeness of real numbers constructed in `Real_ZF_1.thy`. In particular we consider properties of embedding of integers into the set of slopes by the mapping $m \mapsto m^S$, where m^S is defined by $m^S(n) = m \cdot n$.

If m is an integer, then m^S is a slope whose value is $m \cdot n$ for every integer.

```

For any slope f there is an integer m such that there is some slope g that is almost equal to m^S and dominates f in the sense that $f \leq g$ on positive integers (which implies that either g is almost equal to f or $g - f$ is a positive slope. This will be used in `Real_ZF_1.thy` to show that for any real number there is an integer that (whose real embedding) is greater or equal.

50 Construction real numbers - the generic part

```

theory Real_ZF imports Int_ZF_IML Ring_ZF_1

```

```

begin

```

The goal of the `Real_ZF` series of theory files is to provide a construction of the set of real numbers. There are several ways to construct real numbers. Most common start from the rational numbers and use Dedekind cuts or Cauchy sequences. `Real_ZF_x.thy` series formalizes an alternative approach that constructs real numbers directly from the group of integers. Our formalization is mostly based on [2]. Different variants of this construction are

also described in [1] and [3]. I recommend to read these papers, but for the impatient here is a short description: we take a set of maps $s : Z \rightarrow Z$ such that the set $\{s(m+n) - s(m) - s(n)\}_{n,m \in Z}$ is finite (Z means the integers here). We call these maps slopes. Slopes form a group with the natural addition $(s+r)(n) = s(n) + r(n)$. The maps such that the set $s(Z)$ is finite (finite range functions) form a subgroup of slopes. The additive group of real numbers is defined as the quotient group of slopes by the (sub)group of finite range functions. The multiplication is defined as the projection of the composition of slopes into the resulting quotient (coset) space.

50.1 The definition of real numbers

This section contains the construction of the ring of real numbers as classes of slopes - integer almost homomorphisms. The real definitions are in `Group_ZF_2` theory, here we just specialize the definitions of almost homomorphisms, their equivalence and operations to the additive group of integers from the general case of abelian groups considered in `Group_ZF_2`.

The set of slopes is defined as the set of almost homomorphisms on the additive group of integers.

definition

`Slopes` \equiv `AlmostHoms(int,IntegerAddition)`

The first operation on slopes (pointwise addition) is a special case of the first operation on almost homomorphisms.

definition

`SlopeOp1` \equiv `AlHomOp1(int,IntegerAddition)`

The second operation on slopes (composition) is a special case of the second operation on almost homomorphisms.

definition

`SlopeOp2` \equiv `AlHomOp2(int,IntegerAddition)`

Bounded integer maps are functions from integers to integers that have finite range. They play a role of zero in the set of real numbers we are constructing.

definition

`BoundedIntMaps` \equiv `FinRangeFunctions(int,int)`

Bounded integer maps form a normal subgroup of slopes. The equivalence relation on slopes is the (group) quotient relation defined by this subgroup.

definition

`SlopeEquivalenceRel` \equiv `QuotientGroupRel(Slopes,SlopeOp1,BoundedIntMaps)`

The set of real numbers is the set of equivalence classes of slopes.

definition

`RealNumbers` \equiv `Slopes//SlopeEquivalenceRel`

The addition on real numbers is defined as the projection of pointwise addition of slopes on the quotient. This means that the additive group of real numbers is the quotient group: the group of slopes (with pointwise addition) defined by the normal subgroup of bounded integer maps.

definition

`RealAddition` \equiv `ProjFun2(Slopes,SlopeEquivalenceRel,SlopeOp1)`

Multiplication is defined as the projection of composition of slopes on the quotient. The fact that it works is probably the most surprising part of the construction.

definition

`RealMultiplication` \equiv `ProjFun2(Slopes,SlopeEquivalenceRel,SlopeOp2)`

We first show that we can use theorems proven in some proof contexts (locales). The locale `group1` requires assumption that we deal with an abelian group. The next lemma allows to use all theorems proven in the context called `group1`.

lemma `Real_ZF_1_L1: shows group1(int,IntegerAddition)`
`using group1_axioms.intro group1_def Int_ZF_1_T2 by simp`

Real numbers form a ring. This is a special case of the theorem proven in `Ring_ZF_1.thy`, where we show the same in general for almost homomorphisms rather than slopes.

We will need a couple of results from Group_ZF_3.thy The first two that state that the definition of addition and multiplication of real numbers are consistent, that is the result does not depend on the choice of the slopes representing the numbers. The second one implies that what we call SlopeEquivalenceRel is actually an equivalence relation on the set of slopes. We also show that the neutral element of the multiplicative operation on reals (in short number 1) is the class of the identity function on integers.

Identity function on integers is a slope. This lemma concludes the easy part of the construction that follows from the fact that slope equivalence classes form a ring. It is easy to see that multiplication of classes of almost homomorphisms is not commutative in general. The remaining properties of real numbers, like commutativity of multiplication and the existence of multiplicative inverses have to be proven using properties of the group of integers, rather than in general setting of abelian groups.

51 Construction of real numbers

```

theory Real_ZF_1 imports Real_ZF Int_ZF_3 OrderedField_ZF

```

```

begin

```

In this theory file we continue the construction of real numbers started in Real_ZF to a successful conclusion. We put here those parts of the construc-

tion that can not be done in the general settings of abelian groups and require integers.

51.1 Definitions and notation

In this section we define notions and notation needed for the rest of the construction.

We define positive slopes as those that take an infinite number of positive values on the positive integers (see `Int_ZF_2` for properties of positive slopes).

definition

$$\text{PositiveSlopes} \equiv \{s \in \text{Slopes}.$$

$$s(\text{PositiveIntegers}) \cap \text{PositiveIntegers} \notin \text{Fin}(\text{int})\}$$

The order on the set of real numbers is constructed by specifying the set of positive reals. This set is defined as the projection of the set of positive slopes.

definition

$$\text{PositiveReals} \equiv \{\text{SlopeEquivalenceRel}\{s\}. s \in \text{PositiveSlopes}\}$$

The order relation on real numbers is constructed from the set of positive elements in a standard way (see section "Alternative definitions" in `OrderedGroup_ZF`.)

definition

$$\text{OrderOnReals} \equiv \text{OrderFromPosSet}(\text{RealNumbers}, \text{RealAddition}, \text{PositiveReals})$$

The next locale extends the locale `real0` to define notation specific to the construction of real numbers. The notation follows the one defined in `Int_ZF_2.thy`. If m is an integer, then the real number which is the class of the slope $n \mapsto m \cdot n$ is denoted m^R . For a real number a a notation $\lfloor a \rfloor$ means the largest integer m such that the real version of it (that is, m^R) is not greater than a . For an integer m and a subset of reals S the expression $\Gamma(S, m)$ is defined as $\max\{\lfloor p^R \cdot x \rfloor : x \in S\}$. This plays a role in the proof of completeness of real numbers. We also reuse some notation defined in the `int0` context, like \mathbb{Z}_+ (the set of positive integers) and $\text{abs}(m)$ (the absolute value of an integer, and some defined in the `int1` context, like the addition ($+$) and composition (\circ) of slopes.

```

51.2 Multiplication of real numbers

Multiplication of real numbers is defined as a projection of composition of slopes onto the space of equivalence classes of slopes. Thus, the product of the real numbers given as classes of slopes s and r is defined as the class of $s \circ r$. The goal of this section is to show that multiplication defined this way is commutative.

Let's recall a theorem from `Int_ZF_2.thy` that states that if f, g are slopes, then $f \circ g$ is equivalent to $g \circ f$. Here we conclude from that that the classes of $f \circ g$ and $g \circ f$ are the same.

```

lemma (in real1) Real_ZF_1_1_L2: assumes A1:  $f \in \mathcal{S} \quad g \in \mathcal{S}$

It is convenient to have the transitivity of the order on integers in the notation specific to `real1` context. This may be confusing for the presentation

readers: even though \leq and \leq are printed in the same way, they are different symbols in the source. In the `real1` context the former denotes inequality between integers, and the latter denotes inequality between real numbers (classes of slopes). The next lemma is about transitivity of the order relation on integers.

```

51.4 Inverting reals

In this section we tackle the issue of existence of (multiplicative) inverses of real numbers and show that real numbers form an ordered field. We also restate here some facts specific to ordered fields that we need for the construction. The actual proofs of most of these facts can be found in `Field_ZF.thy` and `OrderedField_ZF.thy`

We rewrite the theorem from `Int_ZF_2.thy` that shows that for every positive slope we can find one that is almost equal and has an inverse.

```

lemma (in real1) pos_slopes_have_inv: assumes  $f \in S_+$ 
  shows  $\exists g \in S. f \sim g \wedge (\exists h \in S. g \circ h \sim \text{id}(\text{int}))$

The next lemma provides sufficient condition for an odd function to be an almost homomorphism. It says for odd functions we only need to check that the homomorphism difference (denoted δ in the `real1` context) is bounded on positive integers. This is really proven in `Int_ZF_2.thy`, but we restate it here for convenience. Recall from `Group_ZF_3.thy` that `OddExtension` of a function defined on the set of positive elements (of an ordered group) is the only odd function that is equal to the given one when restricted to positive elements.

lemma (in `real1`) `Real_ZF_1_4_L21A`:
 assumes $A1: f: \mathbb{Z}_+ \rightarrow \text{int} \quad \forall a \in \mathbb{Z}_+. \forall b \in \mathbb{Z}_+. \text{abs}(\delta(f, a, b)) \leq L$
 shows $\text{OddExtension}(\text{int}, \text{IntegerAddition}, \text{IntegerOrder}, f) \in \mathcal{S}$
 using $A1$ `int1.Int_ZF_2_1_L24` by auto

The candidate for (a representant of) the supremum of a nonempty bounded above set is a slope.

lemma (in `real1`) `Real_ZF_1_4_L22`:
 assumes $A1: \text{IsBoundedAbove}(S, \text{OrderOnReals}) \quad S \neq 0$ and
 $A2: g = \{\langle p, \Gamma(S, p) \rangle. p \in \mathbb{Z}_+\}$
 shows $\text{OddExtension}(\text{int}, \text{IntegerAddition}, \text{IntegerOrder}, g) \in \mathcal{S}$
proof -

52 Topology - introduction

```
theory Topology_ZF imports ZF1 Finite_ZF Fol1
```

```
begin
```

This theory file provides basic definitions and properties of topology, open and closed sets, closure and boundary.

52.1 Basic definitions and properties

A typical textbook defines a topology on a set X as a collection T of subsets of X such that $X \in T$, $\emptyset \in T$ and T is closed with respect to arbitrary unions and intersection of two sets. One can notice here that since we always

have $\bigcup T = X$, the set on which the topology is defined (the "carrier" of the topology) can always be constructed from the topology itself and is superfluous in the definition. Moreover, as Marnix Klooster pointed out to me, the fact that the empty set is open can also be proven from other axioms. Hence, we define a topology as a collection of sets that is closed under arbitrary unions and intersections of two sets, without any mention of the set on which the topology is defined. Recall that $\text{Pow}(T)$ is the powerset of T , so that if $M \in \text{Pow}(T)$ then M is a subset of T . The sets that belong to a topology T will be sometimes called "open in" T or just "open" if the topology is clear from the context.

Topology is a collection of sets that is closed under arbitrary unions and intersections of two sets.

definition

$\text{IsATopology } (_ \text{ {is a topology} } [90] \ 91) \text{ where}$
 $T \text{ {is a topology} } \equiv (\forall M \in \text{Pow}(T). \bigcup M \in T) \wedge$
 $(\forall U \in T. \forall V \in T. U \cap V \in T)$

We define interior of a set A as the union of all open sets contained in A . We use $\text{Interior}(A, T)$ to denote the interior of A .

definition

$\text{Interior}(A, T) \equiv \bigcup \{U \in T. U \subseteq A\}$

A set is closed if it is contained in the carrier of topology and its complement is open.

definition

$\text{IsClosed } (\text{infixl } \text{{is closed in} } 90) \text{ where}$
 $D \text{ {is closed in} } T \equiv (D \subseteq \bigcup T \wedge \bigcup T - D \in T)$

To prove various properties of closure we will often use the collection of closed sets that contain a given set A . Such collection does not have a separate name in informal math. We will call it $\text{ClosedCovers}(A, T)$.

definition

$\text{ClosedCovers}(A, T) \equiv \{D \in \text{Pow}(\bigcup T). D \text{ {is closed in} } T \wedge A \subseteq D\}$

The closure of a set A is defined as the intersection of the collection of closed sets that contain A .

definition

$\text{Closure}(A, T) \equiv \bigcap \text{ClosedCovers}(A, T)$

We also define boundary of a set as the intersection of its closure with the closure of the complement (with respect to the carrier).

definition

$\text{Boundary}(A, T) \equiv \text{Closure}(A, T) \cap \text{Closure}(\bigcup T - A, T)$

A set K is compact if for every collection of open sets that covers K we can choose a finite one that still covers the set. Recall that $\text{FinPow}(M)$ is the collection of finite subsets of M (finite powerset of M), defined in IsarMathLib's `Finite_ZF` theory.

definition

```
IsCompact (infixl {is compact in} 90) where
K {is compact in} T  $\equiv$  ( $K \subseteq \bigcup T \wedge$ 
 $(\forall M \in \text{Pow}(T). K \subseteq \bigcup M \longrightarrow (\exists N \in \text{FinPow}(M). K \subseteq \bigcup N))$ )
```

A basic example of a topology: the powerset of any set is a topology.

lemma `Pow_is_top`: `shows Pow(X) {is a topology}`

proof -

```
have  $\forall A \in \text{Pow}(\text{Pow}(X)). \bigcup A \in \text{Pow}(X)$  by fast
moreover have  $\forall U \in \text{Pow}(X). \forall V \in \text{Pow}(X). U \cap V \in \text{Pow}(X)$  by fast
ultimately show Pow(X) {is a topology} using IsATopology_def
by auto
```

qed

Empty set is open.

lemma `empty_open`:

```
assumes T {is a topology} shows  $0 \in T$ 
```

proof -

    by auto
  ultimately show  $(\bigcap \mathcal{M})$  {is a topology}
    using IsATopology_def by simp
qed

```

We will now introduce some notation. In Isar, this is done by defining a "locale". Locale is kind of a context that holds some assumptions and notation used in all theorems proven in it. In the locale (context) below called `topology0` we assume that T is a topology. The interior of the set A (with respect to the topology in the context) is denoted $\text{int}(A)$. The closure of a set $A \subseteq \bigcup T$ is denoted $\text{cl}(A)$ and the boundary is ∂A .

```

locale topology0 =
  fixes T
  assumes topSpaceAssum:  $T$  {is a topology}

  fixes int
  defines int_def [simp]:  $\text{int}(A) \equiv \text{Interior}(A, T)$ 

  fixes cl
  defines cl_def [simp]:  $\text{cl}(A) \equiv \text{Closure}(A, T)$ 

  fixes boundary ( $\partial$ _ [91] 92)
  defines boundary_def [simp]:  $\partial A \equiv \text{Boundary}(A, T)$ 

```

Intersection of a finite nonempty collection of open sets is open.

```

lemma (in topology0) fin_inter_open_open: assumes  $N \neq 0$   $N \in \text{FinPow}(T)$ 
  shows  $\bigcap N \in T$ 
  using topSpaceAssum assms IsATopology_def inter_two_inter_fin
  by simp

```

Having a topology T and a set X we can define the induced topology as the one consisting of the intersections of X with sets from T . The notion of a collection restricted to a set is defined in `ZF1.thy`.

```

lemma (in topology0) Top_1_L4:
  shows  $(T \text{ {restricted to} } X)$  {is a topology}
proof -
  let  $S = T \text{ {restricted to} } X$ 

```

```

have  $\forall A \in \text{Pow}(S). \bigcup A \in S$ 
proof
  fix A assume A1:  $A \in \text{Pow}(S)$

52.2 Interior of a set

In this section we show basic properties of the interior of a set.

Interior of a set A is contained in A .

```

lemma (in topology0) Top_2_L1: shows  $\text{int}(A) \subseteq A$ 
  using Interior_def by auto

```

Interior is open.

```

lemma (in topology0) Top_2_L2: shows  $\text{int}(A) \in T$ 
proof -

```

```

    have {U∈T. U⊆A} ∈ Pow(T) by auto
    with topSpaceAssum show int(A) ∈ T
    using IsATopology_def Interior_def by auto
qed

```

A set is open iff it is equal to its interior.

```

lemma (in topology0) Top_2_L3: shows U∈T ⟷ int(U) = U
proof
  assume U∈T then show int(U) = U
    using Interior_def by auto
next assume A1: int(U) = U
  have int(U) ∈ T using Top_2_L2 by simp
  with A1 show U∈T by simp
qed

```

Interior of the interior is the interior.

```

lemma (in topology0) Top_2_L4: shows int(int(A)) = int(A)
proof -
  let U = int(A)
  from topSpaceAssum have U∈T using Top_2_L2 by simp
  then show int(int(A)) = int(A) using Top_2_L3 by simp
qed

```

Interior of a bigger set is bigger.

```

lemma (in topology0) interior_mono:
  assumes A1: A⊆B shows int(A) ⊆ int(B)
proof -
  from A1 have ∀ U∈T. (U⊆A ⟶ U⊆B) by auto
  then show int(A) ⊆ int(B) using Interior_def by auto
qed

```

An open subset of any set is a subset of the interior of that set.

```

lemma (in topology0) Top_2_L5: assumes U⊆A and U∈T
  shows U ⊆ int(A)
  using assms Interior_def by auto

```

If a point of a set has an open neighborhood contained in the set, then the point belongs to the interior of the set.

```

lemma (in topology0) Top_2_L6: assumes ∃U∈T. (x∈U ∧ U⊆A)
  shows x ∈ int(A)
  using assms Interior_def by auto

```

A set is open iff its every point has a an open neighbourhood contained in the set. We will formulate this statement as two lemmas (implication one way and the other way). The lemma below shows that if a set is open then every point has a an open neighbourhood contained in the set.

```

lemma (in topology0) open_open_neigh:

```

```

    assumes A1:  $V \in T$ 
    shows  $\forall x \in V. \exists U \in T. (x \in U \wedge U \subseteq V)$ 
  proof -
    from A1 have  $\forall x \in V. V \in T \wedge x \in V \wedge V \subseteq V$  by simp
    thus thesis by auto
  qed

```

If every point of a set has a an open neighbourhood contained in the set then the set is open.

```

lemma (in topology0) open_neigh_open:
  assumes A1:  $\forall x \in V. \exists U \in T. (x \in U \wedge U \subseteq V)$ 
  shows  $V \in T$ 
proof -
  from A1 have  $V = \text{int}(V)$  using Top_2_L1 Top_2_L6
  by blast
  then show  $V \in T$  using Top_2_L3 by simp
qed

```

The intersection of interiors is a equal to the interior of intersections.

```

lemma (in topology0) int_inter_int: shows  $\text{int}(A) \cap \text{int}(B) = \text{int}(A \cap B)$ 
proof
  have  $\text{int}(A) \cap \text{int}(B) \subseteq A \cap B$  using Top_2_L1 by auto
  moreover have  $\text{int}(A) \cap \text{int}(B) \in T$  using Top_2_L2 IsATopology_def topSpaceAssum

  by auto
  ultimately show  $\text{int}(A) \cap \text{int}(B) \subseteq \text{int}(A \cap B)$  using Top_2_L5 by simp
  have  $A \cap B \subseteq A$  and  $A \cap B \subseteq B$  by auto
  then have  $\text{int}(A \cap B) \subseteq \text{int}(A)$  and  $\text{int}(A \cap B) \subseteq \text{int}(B)$  using interior_mono
by auto
  thus  $\text{int}(A \cap B) \subseteq \text{int}(A) \cap \text{int}(B)$  by auto
qed

```

52.3 Closed sets, closure, boundary.

This section is devoted to closed sets and properties of the closure and boundary operators.

The carrier of the space is closed.

```

lemma (in topology0) Top_3_L1: shows  $(\bigcup T) \{\text{is closed in}\} T$ 
proof -
  have  $\bigcup T - \bigcup T = 0$  by auto
  with topSpaceAssum have  $\bigcup T - \bigcup T \in T$  using IsATopology_def by auto
  then show thesis using IsClosed_def by simp
qed

```

Empty set is closed.

```

lemma (in topology0) Top_3_L2: shows  $0 \{\text{is closed in}\} T$ 
  using topSpaceAssum IsATopology_def IsClosed_def by simp

```

The collection of closed covers of a subset of the carrier of topology is never empty. This is good to know, as we want to intersect this collection to get the closure.

```
lemma (in topology0) Top_3_L3:
  assumes A1:  $A \subseteq \bigcup T$  shows ClosedCovers(A,T)  $\neq 0$ 
proof -
  from A1 have  $\bigcup T \in \text{ClosedCovers}(A,T)$  using ClosedCovers_def Top_3_L1
  by auto
  thus thesis by auto
qed
```

Intersection of a nonempty family of closed sets is closed.

```
lemma (in topology0) Top_3_L4: assumes A1:  $K \neq 0$  and
  A2:  $\forall D \in K. D \text{ \{is closed in\} } T$ 
  shows  $(\bigcap K) \text{ \{is closed in\} } T$ 
proof -
  from A2 have I:  $\forall D \in K. (D \subseteq \bigcup T \wedge (\bigcup T - D) \in T)$ 
  using IsClosed_def by simp
  then have  $\{\bigcup T - D. D \in K\} \subseteq T$  by auto
  with topSpaceAssum have  $(\bigcup \{\bigcup T - D. D \in K\}) \in T$ 
  using IsATopology_def by auto
  moreover from A1 have  $\bigcup \{\bigcup T - D. D \in K\} = \bigcup T - \bigcap K$  by fast
  moreover from A1 I have  $\bigcap K \subseteq \bigcup T$  by blast
  ultimately show  $(\bigcap K) \text{ \{is closed in\} } T$  using IsClosed_def
  by simp
qed
```

The union and intersection of two closed sets are closed.

```
lemma (in topology0) Top_3_L5:
  assumes A1:  $D_1 \text{ \{is closed in\} } T$   $D_2 \text{ \{is closed in\} } T$ 
  shows
     $(D_1 \cap D_2) \text{ \{is closed in\} } T$ 
     $(D_1 \cup D_2) \text{ \{is closed in\} } T$ 
proof -
  have  $\{D_1, D_2\} \neq 0$  by simp
  with A1 have  $(\bigcap \{D_1, D_2\}) \text{ \{is closed in\} } T$  using Top_3_L4
  by fast
  thus  $(D_1 \cap D_2) \text{ \{is closed in\} } T$  by simp
  from topSpaceAssum A1 have  $(\bigcup T - D_1) \cap (\bigcup T - D_2) \in T$ 
  using IsClosed_def IsATopology_def by simp

53 Topology 1

theory Topology_ZF_1 imports Topology_ZF

begin

In this theory file we study separation axioms and the notion of base and subbase. Using the products of open sets as a subbase we define a natural topology on a product of two topological spaces.

53.1 Separation axioms.

Topological spaces can be classified according to certain properties called "separation axioms". In this section we define what it means that a topological space is T_0 , T_1 or T_2 .

A topology on X is T_0 if for every pair of distinct points of X there is an open set that contains only one of them.

definition

```

isT0 (_ {is T0} [90] 91) where
  T {is T0}  $\equiv \forall x y. ((x \in \bigcup T \wedge y \in \bigcup T \wedge x \neq y) \longrightarrow$ 
     $(\exists U \in T. (x \in U \wedge y \notin U) \vee (y \in U \wedge x \notin U)))$ 

```

A topology is T_1 if for every such pair there exist an open set that contains the first point but not the second.

definition

```

isT1 (_ {is T1} [90] 91) where
  T {is T1}  $\equiv \forall x y. ((x \in \bigcup T \wedge y \in \bigcup T \wedge x \neq y) \longrightarrow$ 
     $(\exists U \in T. (x \in U \wedge y \notin U)))$ 

```

A topology is T_2 (Hausdorff) if for every pair of points there exist a pair of

disjoint open sets each containing one of the points. This is an important class of topological spaces. In particular, metric spaces are Hausdorff.

definition

isT2 ($_ \{is\ T_2\}$ [90] 91) **where**
 $T \{is\ T_2\} \equiv \forall\ x\ y. ((x \in \bigcup T \wedge y \in \bigcup T \wedge x \neq y) \longrightarrow$
 $(\exists U \in T. \exists V \in T. x \in U \wedge y \in V \wedge U \cap V = 0))$

If a topology is T_1 then it is T_0 . We don't really assume here that T is a topology on X . Instead, we prove the relation between isT_0 condition and isT_1 .

lemma $T_1_is_T_0$: **assumes** $A1$: $T \{is\ T_1\}$ **shows** $T \{is\ T_0\}$

proof -

from $A1$ **have** $\forall\ x\ y. x \in \bigcup T \wedge y \in \bigcup T \wedge x \neq y \longrightarrow$
 $(\exists U \in T. x \in U \wedge y \notin U)$
using $isT1_def$ **by** $simp$
then have $\forall\ x\ y. x \in \bigcup T \wedge y \in \bigcup T \wedge x \neq y \longrightarrow$
 $(\exists U \in T. x \in U \wedge y \notin U \vee y \in U \wedge x \notin U)$
by $auto$
then show $T \{is\ T_0\}$ **using** $isT0_def$ **by** $simp$

qed

If a topology is T_2 then it is T_1 .

lemma $T_2_is_T_1$: **assumes** $A1$: $T \{is\ T_2\}$ **shows** $T \{is\ T_1\}$

proof -

{ fix $x\ y$ **assume** $x \in \bigcup T \wedge y \in \bigcup T \wedge x \neq y$
with $A1$ **have** $\exists U \in T. \exists V \in T. x \in U \wedge y \in V \wedge U \cap V = 0$
using $isT2_def$ **by** $auto$
then have $\exists U \in T. x \in U \wedge y \notin U$ **by** $auto$
} **then have** $\forall\ x\ y. x \in \bigcup T \wedge y \in \bigcup T \wedge x \neq y \longrightarrow$
 $(\exists U \in T. x \in U \wedge y \notin U)$ **by** $simp$
then show $T \{is\ T_1\}$ **using** $isT1_def$ **by** $simp$

qed

In a T_0 space two points that can not be separated by an open set are equal. Proof by contradiction.

lemma $Top_1_1_L1$: **assumes** $A1$: $T \{is\ T_0\}$ **and** $A2$: $x \in \bigcup T \wedge y \in \bigcup T$
and $A3$: $\forall U \in T. (x \in U \longleftrightarrow y \in U)$
shows $x = y$

proof -

{ assume $x \neq y$
with $A1\ A2$ **have** $\exists U \in T. x \in U \wedge y \notin U \vee y \in U \wedge x \notin U$
using $isT0_def$ **by** $simp$
with $A3$ **have** $False$ **by** $auto$
} **then show** $x = y$ **by** $auto$

qed

53.2 Bases and subbases.

Sometimes it is convenient to talk about topologies in terms of their bases and subbases. These are certain collections of open sets that define the whole topology.

A base of topology is a collection of open sets such that every open set is a union of the sets from the base.

definition

`IsABaseFor (infixl {is a base for} 65) where`
`B {is a base for} T \equiv $B \subseteq T \wedge T = \{\bigcup A. A \in \text{Pow}(B)\}$`

A subbase is a collection of open sets such that finite intersection of those sets form a base.

definition

`IsASubBaseFor (infixl {is a subbase for} 65) where`
`B {is a subbase for} T \equiv`
 `$B \subseteq T \wedge \{\bigcap A. A \in \text{FinPow}(B)\} \text{ {is a base for} } T$`

Below we formulate a condition that we will prove to be necessary and sufficient for a collection B of open sets to form a base. It says that for any two sets U, V from the collection B we can find a point $x \in U \cap V$ with a neighborhood from B contained in $U \cap V$.

definition

`SatisfiesBaseCondition (_ {satisfies the base condition} [50] 50)`
`where`
`B {satisfies the base condition} \equiv`
 `$\forall U V. ((U \in B \wedge V \in B) \longrightarrow (\forall x \in U \cap V. \exists W \in B. x \in W \wedge W \subseteq U \cap V))$`

A collection that is closed with respect to intersection satisfies the base condition.

`lemma inter_closed_base: assumes $\forall U \in B. (\forall V \in B. U \cap V \in B)$`
`shows B {satisfies the base condition}`
`proof -`
`{ fix U V x assume $U \in B$ and $V \in B$ and $x \in U \cap V$`
`with assms have $\exists W \in B. x \in W \wedge W \subseteq U \cap V$ by blast`
`} then show thesis using SatisfiesBaseCondition_def by simp`
`qed`

Each open set is a union of some sets from the base.

`lemma Top_1_2_L1: assumes B {is a base for} T and $U \in T$`
`shows $\exists A \in \text{Pow}(B). U = \bigcup A$`
`using assms IsABaseFor_def by simp`

Elements of base are open.

`lemma base_sets_open:`
`assumes B {is a base for} T and $U \in B$`

```

shows  $U \in T$ 
using assms IsAbaseFor_def by auto

```

A base defines topology uniquely.

```

lemma same_base_same_top:
  assumes B {is a base for} T and B {is a base for} S
  shows  $T = S$ 
  using assms IsAbaseFor_def by simp

```

Every point from an open set has a neighborhood from the base that is contained in the set.

```

lemma point_open_base_neigh:
  assumes A1: B {is a base for} T and A2:  $U \in T$  and A3:  $x \in U$ 
  shows  $\exists V \in B. V \subseteq U \wedge x \in V$ 
proof -
  from A1 A2 obtain A where  $A \in \text{Pow}(B)$  and  $U = \bigcup A$ 
  using Top_1_2_L1 by blast
  with A3 obtain V where  $V \in A$  and  $x \in V$  by auto
  with  $\langle A \in \text{Pow}(B) \rangle \langle U = \bigcup A \rangle$  show thesis by auto
qed

```

A criterion for a collection to be a base for a topology that is a slight reformulation of the definition. The only thing different that in the definition is that we assume only that every open set is a union of some sets from the base. The definition requires also the opposite inclusion that every union of the sets from the base is open, but that we can prove if we assume that T is a topology.

```

lemma is_a_base_criterion: assumes A1: T {is a topology}
  and A2:  $B \subseteq T$  and A3:  $\forall V \in T. \exists A \in \text{Pow}(B). V = \bigcup A$ 
  shows B {is a base for} T
proof -
  from A3 have  $T \subseteq \{\bigcup A. A \in \text{Pow}(B)\}$  by auto
  moreover have  $\{\bigcup A. A \in \text{Pow}(B)\} \subseteq T$ 
  proof
    fix U assume  $U \in \{\bigcup A. A \in \text{Pow}(B)\}$ 
    then obtain A where  $A \in \text{Pow}(B)$  and  $U = \bigcup A$ 
    by auto
    with  $\langle B \subseteq T \rangle$  have  $A \in \text{Pow}(T)$  by auto
    with A1  $\langle U = \bigcup A \rangle$  show  $U \in T$ 
    unfolding IsATopology_def by simp
  qed
  ultimately have  $T = \{\bigcup A. A \in \text{Pow}(B)\}$  by auto
  with A2 show B {is a base for} T
  unfolding IsAbaseFor_def by simp
qed

```

A necessary condition for a collection of sets to be a base for some topology : every point in the intersection of two sets in the base has a neighborhood from the base contained in the intersection.

```

lemma Top_1_2_L2:
  assumes A1:  $\exists T. T \text{ \{is a topology\} } \wedge B \text{ \{is a base for\} } T$ 
  and A2:  $\forall B \ W \in B$ 
  shows  $\forall x \in V \cap W. \exists U \in B. x \in U \wedge U \subseteq V \cap W$ 
proof -
  from A1 obtain T where
    D1:  $T \text{ \{is a topology\} } \quad B \text{ \{is a base for\} } T$ 
  by auto
  then have  $B \subseteq T$  using IsAbaseFor_def by auto
  with A2 have  $\forall T \text{ and } W \in T$  using IsAbaseFor_def by auto
  with D1 have  $\exists A \in \text{Pow}(B). V \cap W = \bigcup A$  using IsATopology_def Top_1_2_L1
  by auto
  then obtain A where  $A \subseteq B$  and  $V \cap W = \bigcup A$  by auto
  then show  $\forall x \in V \cap W. \exists U \in B. (x \in U \wedge U \subseteq V \cap W)$  by auto
qed

```

We will construct a topology as the collection of unions of (would-be) base. First we prove that if the collection of sets satisfies the condition we want to show to be sufficient, the the intersection belongs to what we will define as topology (am I clear here?). Having this fact ready simplifies the proof of the next lemma. There is not much topology here, just some set theory.

```

lemma Top_1_2_L3:
  assumes A1:  $\forall x \in V \cap W. \exists U \in B. x \in U \wedge U \subseteq V \cap W$ 
  shows  $V \cap W \in \{\bigcup A. A \in \text{Pow}(B)\}$ 
proof
  let A =  $\bigcup_{x \in V \cap W}. \{U \in B. x \in U \wedge U \subseteq V \cap W\}$ 
  show  $A \in \text{Pow}(B)$  by auto
  from A1 show  $V \cap W = \bigcup A$  by blast
qed

```

The next lemma is needed when proving that the would-be topology is closed with respect to taking intersections. We show here that intersection of two sets from this (would-be) topology can be written as union of sets from the topology.

```

lemma Top_1_2_L4:
  assumes A1:  $U_1 \in \{\bigcup A. A \in \text{Pow}(B)\} \quad U_2 \in \{\bigcup A. A \in \text{Pow}(B)\}$ 
  and A2:  $B \text{ \{satisfies the base condition\} }$ 
  shows  $\exists C. C \subseteq \{\bigcup A. A \in \text{Pow}(B)\} \wedge U_1 \cap U_2 = \bigcup C$ 
proof -
  from A1 A2 obtain A1 A2 where
    D1:  $A_1 \in \text{Pow}(B) \quad U_1 = \bigcup A_1 \quad A_2 \in \text{Pow}(B) \quad U_2 = \bigcup A_2$ 
  by auto
  let C =  $\bigcup_{U \in A_1. \{U \cap V. V \in A_2\}}$ 
  from D1 have  $(\forall U \in A_1. U \in B) \wedge (\forall V \in A_2. V \in B)$  by auto
  with A2 have  $C \subseteq \{\bigcup A. A \in \text{Pow}(B)\}$ 
  using Top_1_2_L3 SatisfiesBaseCondition_def by auto
  moreover from D1 have  $U_1 \cap U_2 = \bigcup C$  by auto
  ultimately show thesis by auto

```

53.3 Product topology

In this section we consider a topology defined on a product of two sets.

Given two topological spaces we can define a topology on the product of the carriers such that the cartesian products of the sets of the topologies are a base for the product topology. Recall that for two collections S, T of sets the product collection is defined (in ZF1.thy) as the collections of cartesian products $A \times B$, where $A \in S, B \in T$.

definition

```

ProductTopology(T,S) ≡ {⋃ W. W ∈ Pow(ProductCollection(T,S))}

```

The product collection satisfies the base condition.

```

lemma Top_1_4_L1:
  assumes A1: T {is a topology}   S {is a topology}
  and A2: A ∈ ProductCollection(T,S)  B ∈ ProductCollection(T,S)
  shows ∀ x ∈ (A ∩ B). ∃ W ∈ ProductCollection(T,S). (x ∈ W ∧ W ⊆ A ∩ B)
proof
  fix x assume A3: x ∈ A ∩ B
  from A2 obtain U1 V1 U2 V2 where
    D1: U1 ∈ T  V1 ∈ S  A = U1 × V1  U2 ∈ T  V2 ∈ S  B = U2 × V2
    using ProductCollection_def by auto
  let W = (U1 ∩ U2) × (V1 ∩ V2)
  from A1 D1 have U1 ∩ U2 ∈ T and V1 ∩ V2 ∈ S
    using IsATopology_def by auto
  then have W ∈ ProductCollection(T,S) using ProductCollection_def
    by auto
  moreover from A3 D1 have x ∈ W and W ⊆ A ∩ B by auto
  ultimately have ∃ W. (W ∈ ProductCollection(T,S) ∧ x ∈ W ∧ W ⊆ A ∩ B)
    by auto
  thus ∃ W ∈ ProductCollection(T,S). (x ∈ W ∧ W ⊆ A ∩ B) by auto
qed

```

The product topology is indeed a topology on the product.

54 Metric spaces

theory MetricSpace_ZF **imports** Topology_ZF_1 OrderedLoop_ZF Lattice_ZF
begin

A metric space is a set on which a distance between points is defined as a function $d : X \times X \rightarrow [0, \infty)$. With this definition each metric space is a topological space which is paracompact and Hausdorff (T_2), hence normal (in fact even perfectly normal).

54.1 Pseudometric - definition and basic properties

A metric on X is usually defined as a function $d : X \times X \rightarrow [0, \infty)$ that satisfies the conditions $d(x, x) = 0$, $d(x, y) = 0 \Rightarrow x = y$ (identity of indiscernibles), $d(x, y) = d(y, x)$ (symmetry) and $d(x, y) \leq d(x, z) + d(z, y)$ (triangle inequality) for all $x, y \in X$. Here we are going to be a bit more general and define metric and pseudo-metric as a function valued in an ordered loop.

First we define a pseudo-metric, which has the axioms of a metric, but without the second part of the identity of indiscernibles. In our definition **IsApseudoMetric** is a predicate on five sets: the function d , the set X on which the metric is defined, the loop carrier G , the loop operation A and the order r on G .

definition

$$\begin{aligned} \text{IsApseudoMetric}(d, X, G, A, r) \equiv & d : X \times X \rightarrow \text{Nonnegative}(G, A, r) \\ & \wedge (\forall x \in X. d\langle x, x \rangle = \text{TheNeutralElement}(G, A)) \\ & \wedge (\forall x \in X. \forall y \in X. d\langle x, y \rangle = d\langle y, x \rangle) \\ & \wedge (\forall x \in X. \forall y \in X. \forall z \in X. \langle d\langle x, z \rangle, A\langle d\langle x, y \rangle, d\langle y, z \rangle \rangle \in r) \end{aligned}$$

We add the full axiom of identity of indiscernibles to the definition of a pseudometric to get the definition of metric.

definition

$$\begin{aligned} \text{IsAMetric}(d, X, G, A, r) \equiv & \\ & \text{IsApseudoMetric}(d, X, G, A, r) \wedge (\forall x \in X. \forall y \in X. d\langle x, y \rangle = \text{TheNeutralElement}(G, A) \\ \longrightarrow & x = y) \end{aligned}$$

A disk is defined as set of points located less than the radius from the center.

definition $\text{Disk}(X, d, r, c, R) \equiv \{x \in X. \langle d\langle c, x \rangle, R \rangle \in \text{StrictVersion}(r)\}$

Next we define notation for metric spaces. We will reuse the additive notation defined in the `loop1` locale adding only the assumption about d being a pseudometric and notation for a disk centered at c with radius R . Since for many theorems it is sufficient to assume the pseudometric axioms we will assume in this context that the sets d, X, L, A, r form a pseudometric rather than a metric.

```

locale pmetric_space = loop1 +
  fixes d and X

  assumes pmetricAssum: IsApseudoMetric(d,X,L,A,r)

  fixes disk
  defines disk_def [simp]: disk(c,R)  $\equiv$  Disk(X,d,r,c,R)

```

The next lemma shows the definition of the pseudometric in the notation used in the `metric_space` context.

```

lemma (in pmetric_space) pmetric_properties: shows
  d: X×X  $\rightarrow$  L+
   $\forall x \in X. d\langle x, x \rangle = 0$ 
   $\forall x \in X. \forall y \in X. d\langle x, y \rangle = d\langle y, x \rangle$ 
   $\forall x \in X. \forall y \in X. \forall z \in X. d\langle x, z \rangle \leq d\langle x, y \rangle + d\langle y, z \rangle$ 
  using pmetricAssum unfolding IsApseudoMetric_def by auto

```

The definition of the disk in the notation used in the `pmetric_space` context:

```

lemma (in pmetric_space) disk_definition: shows disk(c,R) = {x∈X. d⟨c,x⟩ < R}
proof -
  have disk(c,R) = Disk(X,d,r,c,R) by simp
  then have disk(c,R) = {x∈X. ⟨d⟨c,x⟩,R⟩ ∈ StrictVersion(r)} unfolding
    Disk_def by simp
  moreover have  $\forall x \in X. \langle d\langle c, x \rangle, R \rangle \in \text{StrictVersion}(r) \longleftrightarrow d\langle c, x \rangle < R$

55 Basic properties of real numbers

```
theory Real_ZF_2 imports OrderedField_ZF MetricSpace_ZF
```

begin

Isabelle/ZF and IsarMathLib do not have a set of real numbers built-in. The `Real_ZF` and `Real_ZF_1` theories provide a construction but here we do not use it in any way and we just assume that we have a model of real numbers (i.e. a completely ordered field) as defined in the `Ordered_Field` theory. The construction only assures us that objects with the desired properties exist in the ZF world.

55.1 Basic notation for real numbers

In this section we define notation that we will use whenever real numbers play a role, i.e. most of mathematics.

The next locale sets up notation for contexts where real numbers are used.

```

locale reals =
  fixes Reals( $\mathbb{R}$ ) and Add and Mul and ROrd
  assumes R_are_reals: IsAmodelOfReals( $\mathbb{R}$ ,Add,Mul, ROrd)

  fixes zero (0)
  defines zero_def[simp]: 0  $\equiv$  TheNeutralElement( $\mathbb{R}$ ,Add)

  fixes one (1)
  defines one_def[simp]: 1  $\equiv$  TheNeutralElement( $\mathbb{R}$ ,Mul)

  fixes realmul (infixl  $\cdot$  71)
  defines realmul_def[simp]:  $x \cdot y \equiv \text{Mul}\langle x,y \rangle$ 

  fixes realadd (infixl  $+$  69)
  defines realadd_def[simp]:  $x + y \equiv \text{Add}\langle x,y \rangle$ 

  fixes realminus(- _ 89)
  defines realminus_def[simp]:  $(-x) \equiv \text{GroupInv}(\mathbb{R},\text{Add})(x)$ 

  fixes realsub (infixl  $-$  90)
  defines realsub_def [simp]:  $x - y \equiv x + (-y)$ 

  fixes lesseq (infix  $\leq$  68)
  defines lesseq_def [simp]:  $x \leq y \equiv \langle x,y \rangle \in \text{ROrd}$ 

  fixes sless (infix  $<$  68)
  defines sless_def [simp]:  $x < y \equiv x \leq y \wedge x \neq y$ 

  fixes nonnegative ( $\mathbb{R}^+$ )
  defines nonnegative_def[simp]:  $\mathbb{R}^+ \equiv \text{Nonnegative}(\mathbb{R},\text{Add}, \text{ROrd})$ 

  fixes positiveset ( $\mathbb{R}_+$ )
  defines positiveset_def[simp]:  $\mathbb{R}_+ \equiv \text{PositiveSet}(\mathbb{R},\text{Add}, \text{ROrd})$ 

```

```

fixes setinv (- _ 72)
defines setninv_def [simp]: -A  $\equiv$  GroupInv( $\mathbb{R}$ ,Add)(A)

fixes non_zero ( $\mathbb{R}_0$ )
defines non_zero_def[simp]:  $\mathbb{R}_0 \equiv \mathbb{R} - \{0\}$ 

fixes abs (| _ |)
defines abs_def [simp]:  $|x| \equiv \text{AbsoluteValue}(\mathbb{R}, \text{Add}, \text{ROrd})(x)$ 

fixes dist
defines dist_def[simp]:  $\text{dist} \equiv \{\langle p, |\text{fst}(p) - \text{snd}(p)| \rangle \mid p \in \mathbb{R} \times \mathbb{R}\}$ 

fixes two (2)
defines two_def[simp]:  $2 \equiv 1 + 1$ 

fixes inv ( $_{-}^{-1}$  [96] 97)
defines inv_def[simp]:
   $x^{-1} \equiv \text{GroupInv}(\mathbb{R}_0, \text{restrict}(\text{Mul}, \mathbb{R}_0 \times \mathbb{R}_0))(x)$ 

fixes realsq ( $_{-}^2$  [96] 97)
defines realsq_def [simp]:  $x^2 \equiv x \cdot x$ 

fixes oddext ( $_{-}^{\circ}$ )
defines oddext_def [simp]:  $f^{\circ} \equiv \text{OddExtension}(\mathbb{R}, \text{Add}, \text{ROrd}, f)$ 

fixes disk
defines disk_def [simp]:  $\text{disk}(c, r) \equiv \text{Disk}(\mathbb{R}, \text{dist}, \text{ROrd}, c, r)$ 

```

56 Complex numbers

```

theory Complex_ZF imports func_ZF_1 OrderedField_ZF

```

```

begin

```

The goal of this theory is to define complex numbers and prove that the Metamath complex numbers axioms hold.

56.1 From complete ordered fields to complex numbers

This section consists mostly of definitions and a proof context for talking about complex numbers. Suppose we have a set R with binary operations A and M and a relation r such that the quadruple (R, A, M, r) forms a complete ordered field. The next definitions take (R, A, M, r) and construct the sets that represent the structure of complex numbers: the carrier ($\mathbb{C} = R \times R$), binary operations of addition and multiplication of complex numbers and the order relation on $\mathbb{R} = R \times 0$. The `ImCxAdd`, `ReCxAdd`, `ImCxMul`, `ReCxMul` are helper meta-functions representing the imaginary part of a sum of complex numbers, the real part of a sum of real numbers, the imaginary part of a product of complex numbers and the real part of a product of real numbers, respectively. The actual operations (subsets of $(R \times R) \times R$ are named `CplxAdd` and `CplxMul`.

When R is an ordered field, it comes with an order relation. This induces a natural strict order relation on $\{\langle x, 0 \rangle : x \in R\} \subseteq R \times R$. We call the set $\{\langle x, 0 \rangle : x \in R\}$ `ComplexReals(R,A)` and the strict order relation `CplxROrder(R,A,r)`. The order on the real axis of complex numbers is defined as the relation induced on it by the canonical projection on the first coordinate and the order we have on the real numbers. OK, lets repeat this slower. We start with the order relation r on a (model of) real numbers R . We want to define an order relation on a subset of complex numbers, namely on $R \times \{0\}$. To do that we use the notion of a relation induced by a mapping. The mapping here is $f : R \times \{0\} \rightarrow R, f\langle x, 0 \rangle = x$ which is defined under a name of `SliceProjection` in `func_ZF.thy`. This defines a relation r_1 (called `InducedRelation(f,r)`, see `func_ZF`) on $R \times \{0\}$ such that $\langle \langle x, 0 \rangle, \langle y, 0 \rangle \in r_1$ iff $\langle x, y \rangle \in r$. This way we get what we call `CplxROrder(R,A,r)`. However, this is not the end of the story, because Metamath uses strict inequalities in its axioms, rather than weak ones like `IsarMathLib` (mostly). So we need to take the strict version of this order relation. This is done in the syntax definition of $<_{\mathbb{R}}$ in the definition of `complex0` context. Since Metamath proves a lot of theorems about the real numbers extended with $+\infty$ and $-\infty$, we define the notation for inequalities on the extended real line as well.

A helper expression representing the real part of the sum of two complex numbers.

definition

$$\text{ReCxAdd}(R,A,a,b) \equiv A(\text{fst}(a), \text{fst}(b))$$

An expression representing the imaginary part of the sum of two complex numbers.

definition

$$\text{ImCxAdd}(R, A, a, b) \equiv A\langle \text{snd}(a), \text{snd}(b) \rangle$$

The set (function) that is the binary operation that adds complex numbers.

definition

$$\begin{aligned} \text{CplxAdd}(R, A) \equiv \\ \{ \langle p, \langle \text{ReCxAdd}(R, A, \text{fst}(p), \text{snd}(p)), \text{ImCxAdd}(R, A, \text{fst}(p), \text{snd}(p)) \rangle \rangle \mid \\ p \in (R \times R) \times (R \times R) \} \end{aligned}$$

The expression representing the imaginary part of the product of complex numbers.

definition

$$\text{ImCxMul}(R, A, M, a, b) \equiv A\langle M\langle \text{fst}(a), \text{snd}(b) \rangle, M\langle \text{snd}(a), \text{fst}(b) \rangle \rangle$$

The expression representing the real part of the product of complex numbers.

definition

$$\begin{aligned} \text{ReCxMul}(R, A, M, a, b) \equiv \\ A\langle M\langle \text{fst}(a), \text{fst}(b) \rangle, \text{GroupInv}(R, A) (M\langle \text{snd}(a), \text{snd}(b) \rangle) \rangle \end{aligned}$$

The function (set) that represents the binary operation of multiplication of complex numbers.

definition

$$\begin{aligned} \text{CplxMul}(R, A, M) \equiv \\ \{ \langle p, \langle \text{ReCxMul}(R, A, M, \text{fst}(p), \text{snd}(p)), \text{ImCxMul}(R, A, M, \text{fst}(p), \text{snd}(p)) \rangle \rangle \mid \\ p \in (R \times R) \times (R \times R) \} \end{aligned}$$

The definition real numbers embedded in the complex plane.

definition

$$\text{ComplexReals}(R, A) \equiv R \times \{\text{TheNeutralElement}(R, A)\}$$

Definition of order relation on the real line.

definition

$$\begin{aligned} \text{CplxROrder}(R, A, r) \equiv \\ \text{InducedRelation}(\text{SliceProjection}(\text{ComplexReals}(R, A)), r) \end{aligned}$$

The next locale defines proof context and notation that will be used for complex numbers.

57 Topology 1b

theory Topology_ZF_1b imports Topology_ZF_1

begin

One of the facts demonstrated in every class on General Topology is that in a T_2 (Hausdorff) topological space compact sets are closed. Formalizing the proof of this fact gave me an interesting insight into the role of the Axiom of Choice (AC) in many informal proofs.

A typical informal proof of this fact goes like this: we want to show that the complement of K is open. To do this, choose an arbitrary point $y \in K^c$. Since X is T_2 , for every point $x \in K$ we can find an open set U_x such that $y \notin \overline{U_x}$. Obviously $\{U_x\}_{x \in K}$ covers K , so select a finite subcollection that covers K , and so on. I had never realized that such reasoning requires the Axiom of Choice. Namely, suppose we have a lemma that states "In T_2 spaces, if $x \neq y$, then there is an open set U such that $x \in U$ and $y \notin \overline{U}$ " (like our lemma `T2_c1_open_sep` below). This only states that the set of such open sets U is not empty. To get the collection $\{U_x\}_{x \in K}$ in this proof we

have to select one such set among many for every $x \in K$ and this is where we use the Axiom of Choice. Probably in 99/100 cases when an informal calculus proof states something like $\forall \varepsilon \exists \delta_\varepsilon \dots$ the proof uses AC. Most of the time the use of AC in such proofs can be avoided. This is also the case for the fact that in a T_2 space compact sets are closed.

57.1 Compact sets are closed - no need for AC

In this section we show that in a T_2 topological space compact sets are closed.

First we prove a lemma that in a T_2 space two points can be separated by the closure of an open set.

```
lemma (in topology0) T2_cl_open_sep:

58 Topology 2

```
theory Topology_ZF_2 imports Topology_ZF_1 func1 Fol1
```

```
begin
```

This theory continues the series on general topology and covers the definition and basic properties of continuous functions. We also introduce the notion of homeomorphism and prove the pasting lemma.

58.1 Continuous functions.

In this section we define continuous functions and prove that certain conditions are equivalent to a function being continuous.

In standard math we say that a function is continuous with respect to two topologies τ_1, τ_2 if the inverse image of sets from topology τ_2 are in τ_1 . Here we define a predicate that is supposed to reflect that definition, with a difference that we don't require in the definition that τ_1, τ_2 are topologies. This means for example that when we define measurable functions, the definition will be the same.

The notation $f^-(A)$ means the inverse image of (a set) A with respect to (a function) f .

definition

$\text{IsContinuous}(\tau_1, \tau_2, f) \equiv (\forall U \in \tau_2. f^-(U) \in \tau_1)$

A trivial example of a continuous function - identity is continuous.

lemma `id_cont`: **shows** $\text{IsContinuous}(\tau, \tau, \text{id}(\bigcup \tau))$

proof -

```
{ fix U assume U ∈ τ
  then have id(⋃τ)-(U) = U using vimage_id_same by auto
  with (U ∈ τ) have id(⋃τ)-(U) ∈ τ by simp
} then show IsContinuous(τ, τ, id(⋃τ)) using IsContinuous_def
  by simp
```

qed

We will work with a pair of topological spaces. The following locale sets up our context that consists of two topologies τ_1, τ_2 and a continuous function $f : X_1 \rightarrow X_2$, where X_i is defined as $\bigcup \tau_i$ for $i = 1, 2$. We also define notation $\text{cl}_1(A)$ and $\text{cl}_2(A)$ for closure of a set A in topologies τ_1 and τ_2 , respectively.

locale `two_top_spaces0` =

```
fixes τ1
assumes tau1_is_top: τ1 {is a topology}

fixes τ2
assumes tau2_is_top: τ2 {is a topology}

fixes X1
defines X1_def [simp]: X1 ≡ ⋃τ1

fixes X2
defines X2_def [simp]: X2 ≡ ⋃τ2

fixes f
assumes fmapAssum: f: X1 → X2
```

```

fixes isContinuous (_ {is continuous} [50] 50)

58.3 Topologies induced by mappings

In this section we consider various ways a topology may be defined on a set that is the range (or the domain) of a function whose domain (or range) is a topological space.

A bijection from a topological space induces a topology on the range.

theorem `bij_induced_top`: assumes `A1: T {is a topology}` and `A2: f ∈ bij(⋃T,Y)`
shows
`{f(U). U∈T} {is a topology}` and
`{ {f(x).x∈U}. U∈T} {is a topology}` and
`(⋃ {f(U). U∈T}) = Y` and
`IsAhomeomorphism(T, {f(U). U∈T},f)`

proof -

from `A2` have `f ∈ inj(⋃T,Y)` using `bij_def` by simp

then have `f:⋃T→Y` using `inj_def` by simp

let `S = {f(U). U∈T}`

{ fix `M` assume `M ∈ Pow(S)`

let `MT = {f-(V). V∈M}`

have `MT ⊆ T`

proof

fix `W` assume `W∈MT`

then obtain `V` where `V∈M` and `I: W = f-(V)` by auto

with `⟨M ∈ Pow(S)⟩` have `V∈S` by auto

then obtain `U` where `U∈T` and `V = f(U)` by auto

with `I` have `W = f-(f(U))` by simp

with `⟨f ∈ inj(⋃T,Y)⟩` `⟨U∈T⟩` have `W = U` using `inj_vimage_image` by

`blast`

with `⟨U∈T⟩` show `W∈T` by simp

qed

with `A1` have `(⋃MT) ∈ T` using `IsATopology_def` by simp

hence `f(⋃MT) ∈ S` by auto

moreover have `f(⋃MT) = ⋃M`

proof -

58.4 Partial functions and continuity

Suppose we have two topologies τ_1, τ_2 on sets $X_i = \bigcup \tau_i, i = 1, 2$. Consider some function $f : A \rightarrow X_2$, where $A \subseteq X_1$ (we will call such function "partial"). In such situation we have two natural possibilities for the pairs of topologies with respect to which this function may be continuous. One is obviously the original τ_1, τ_2 and in the second one the first element of the pair is the topology relative to the domain of the function: $\{A \cap U | U \in \tau_1\}$. These two possibilities are not exactly the same and the goal of this section is to explore the differences.

If a function is continuous, then its restriction is continuous in relative topology.

```
lemma (in two_top_spaces0) restr_cont:
  assumes A1:  $A \subseteq X_1$  and A2:  $f$  {is continuous}
  shows IsContinuous( $\tau_1$  {restricted to}  $A, \tau_2, \text{restrict}(f, A)$ )
proof -
  let  $g = \text{restrict}(f, A)$ 
  { fix  $U$  assume  $U \in \tau_2$ 
    with A2 have  $f^{-1}(U) \in \tau_1$  using IsContinuous_def by simp
    moreover from A1 have  $g^{-1}(U) = f^{-1}(U) \cap A$ 
      using fmapAssum func1_2_L1 by simp

58.5 Product topology and continuity

We start with three topological spaces (τ_1, X_1) , (τ_2, X_2) and (τ_3, X_3) and a function $f : X_1 \times X_2 \rightarrow X_3$. We will study the properties of f with respect to the product topology $\tau_1 \times \tau_2$ and τ_3 . This situation is similar as in locale `two_top_spaces0` but the first topological space is assumed to be a product of two topological spaces.

First we define a locale with three topological spaces.

```

locale prod_top_spaces0 =
  fixes  $\tau_1$ 
  assumes tau1_is_top:  $\tau_1$  {is a topology}

```

```

fixes  $\tau_2$ 
assumes tau2_is_top:  $\tau_2$  {is a topology}

fixes  $\tau_3$ 
assumes tau3_is_top:  $\tau_3$  {is a topology}

fixes  $X_1$ 
defines X1_def [simp]:  $X_1 \equiv \bigcup \tau_1$ 

fixes  $X_2$ 
defines X2_def [simp]:  $X_2 \equiv \bigcup \tau_2$ 

fixes  $X_3$ 
defines X3_def [simp]:  $X_3 \equiv \bigcup \tau_3$ 

fixes  $\eta$ 
defines eta_def [simp]:  $\eta \equiv \text{ProductTopology}(\tau_1, \tau_2)$ 

```

58.6 Pasting lemma

The classical pasting lemma states that if U_1, U_2 are both open (or closed) and a function is continuous when restricted to both U_1 and U_2 then it is continuous when restricted to $U_1 \cup U_2$. In this section we prove a generalization statement stating that the set $\{U \in \tau_1 \mid f|_U \text{ is continuous}\}$ is a topology.

A typical statement of the pasting lemma uses the notion of a function restricted to a set being continuous without specifying the topologies with respect to which this continuity holds. In `two_top_spaces0` context the notation `g {is continuous}` means continuity with respect to topologies τ_1, τ_2 .

The next lemma is a special case of `partial_fun_cont` and states that if for some set $A \subseteq X_1 = \bigcup \tau_1$ the function $f|_A$ is continuous (with respect to (τ_1, τ_2)), then A has to be open. This clears up terminology and indicates why we need to pay attention to the issue of which topologies we talk about when we say that the restricted (to some closed set for example) function is continuous.

59 Topology 3

theory Topology_ZF_3 imports Topology_ZF_2 FiniteSeq_ZF

begin

Topology_ZF_1 theory describes how we can define a topology on a product of two topological spaces. One way to generalize that is to construct topology for a cartesian product of n topological spaces. The cartesian product approach is somewhat inconvenient though. Another way to approach product topology on X^n is to model cartesian product as sets of sequences (of length n) of elements of X . This means that having a topology on X we want to define a topology on the space $n \rightarrow X$, where n is a natural number (recall that $n = \{0, 1, \dots, n-1\}$ in ZF). However, this in turn can be done more generally by defining a topology on any function space $I \rightarrow X$, where I is any set of indices. This is what we do in this theory.

59.1 The base of the product topology

In this section we define the base of the product topology.

Suppose $\mathcal{X} = I \rightarrow \bigcup T$ is a space of functions from some index set I to the carrier of a topology T . Then take a finite collection of open sets $W : N \rightarrow T$ indexed by $N \subseteq I$. We can define a subset of \mathcal{X} that models the cartesian product of W .

definition

$\text{FinProd}(\mathcal{X}, W) \equiv \{x \in \mathcal{X}. \forall i \in \text{domain}(W). x(i) \in W(i)\}$

Now we define the base of the product topology as the collection of all finite products (in the sense defined above) of open sets.

definition

$$\text{ProductTopBase}(I, T) \equiv \bigcup_{N \in \text{FinPow}(I)} \{ \text{FinProd}(I \rightarrow \bigcup T, W) \mid W \in N \rightarrow T \}$$

Finally, we define the product topology on sequences. We use the "Seq" prefix although the definition is good for any index sets, not only natural numbers.

definition

$$\text{SeqProductTopology}(I, T) \equiv \{ \bigcup B \mid B \in \text{Pow}(\text{ProductTopBase}(I, T)) \}$$

Product topology base is closed with respect to intersections.

lemma prod_top_base_inter:

assumes A1: T {is a topology} and
A2: $U \in \text{ProductTopBase}(I, T)$ $V \in \text{ProductTopBase}(I, T)$
shows $U \cap V \in \text{ProductTopBase}(I, T)$

proof -

```

59.2 Finite product of topologies

As a special case of the space of functions $I \rightarrow X$ we can consider space of lists of elements of X , i.e. space $n \rightarrow X$, where n is a natural number (recall that in ZF set theory $n = \{0, 1, \dots, n-1\}$). Such spaces model finite cartesian products X^n but are easier to deal with in formalized way (than the said products). This section discusses natural topology defined on $n \rightarrow X$ where X is a topological space.

When the index set is finite, the definition of $\text{ProductTopBase}(I, T)$ can be simplified.

```

Intuitively, the topological space of singleton lists valued in X is the same as X . However, each element of this space is a list of length one, i.e a set consisting of a pair $\langle 0, x \rangle$ where x is an element of X . The next lemma provides a formula for the product topology in the corner case when we have only one factor and shows that the product topology of one space is essentially the same as the space.

In the `Topology_ZF_2` theory we define product topology of two topological spaces. The next lemma explains in what sense the topology on finite lists of length n of elements of topological space X can be thought as a model of the product topology on the cartesian product of n copies of that space. Namely, we show that the space of lists of length $n + 1$ of elements of X is homeomorphic to the product topology (as defined in `Topology_ZF_2`) of two spaces: the space of lists of length n and X . Recall that if \mathcal{B} is a base (i.e. satisfies the base condition), then the collection $\{\bigcup B \mid B \in \text{Pow}(\mathcal{B})\}$ is a topology (generated by \mathcal{B}).

This theory deals with convergence in topological spaces. Contributed by Daniel de la Concepcion.

60.1 Nets

Nets are a generalization of sequences. It is known that sequences do not determine the behavior of the topological spaces that are not first countable; i.e., have a countable neighborhood base for each point. To solve this problem, nets were defined so that the behavior of any topological space can be thought in terms of convergence of nets.

First we need to define what a directed set is:

definition

```
IsDirectedSet (_ directs _ 90)
  where r directs D  $\equiv$  refl(D,r)  $\wedge$  trans(r)  $\wedge$  ( $\forall x \in D. \forall y \in D. \exists z \in D. \langle x, z \rangle \in r$ 
 $\wedge \langle y, z \rangle \in r$ )
```

Any linear order is a directed set; in particular (\mathbb{N}, \leq) .

lemma linorder_imp_directed:

```
  assumes IsLinOrder(X,r)
  shows r directs X
```

proof-

```
  from assms have trans(r) using IsLinOrder_def by auto
  moreover
  from assms have r:refl(X,r) using IsLinOrder_def total_is_refl by auto
  moreover
  {
    fix x y
    assume R: x  $\in$  X y  $\in$  X
    with assms have  $\langle x, y \rangle \in r \vee \langle y, x \rangle \in r$  using IsLinOrder_def IsTotal_def
  by auto
    with r have ( $\langle x, y \rangle \in r \wedge \langle y, y \rangle \in r$ )  $\vee$  ( $\langle y, x \rangle \in r \wedge \langle x, x \rangle \in r$ ) using R refl_def
  by auto
    then have  $\exists z \in X. \langle x, z \rangle \in r \wedge \langle y, z \rangle \in r$  using R by auto
  }
  ultimately show thesis using IsDirectedSet_def function_def by auto
qed
```

Natural numbers are a directed set.

corollary Le_directs_nat:

```
  shows IsLinOrder(nat,Le) Le directs nat
```

proof -

```
  show IsLinOrder(nat,Le) by (rule NatOrder_ZF_1_L2)
  then show Le directs nat using linorder_imp_directed by auto
qed
```

We are able to define the concept of net, now that we now what a directed set is.

definition

```
IsNet (_ {is a net on} _ 90)
  where N {is a net on} X  $\equiv$  fst(N):domain(fst(N)) $\rightarrow$ X  $\wedge$  (snd(N) directs
domain(fst(N)))  $\wedge$  domain(fst(N)) $\neq$ 0
```

Provided a topology and a net directed on its underlying set, we can talk about convergence of the net in the topology.

definition (in topology0)

```
NetConverges (_  $\rightarrow_N$  _ 90)
  where N {is a net on}  $\bigcup T \implies N \rightarrow_N x \equiv$ 
  ( $x \in \bigcup T$ )  $\wedge$  ( $\forall U \in \text{Pow}(\bigcup T). (x \in \text{int}(U) \longrightarrow (\exists t \in \text{domain}(\text{fst}(N)). \forall m \in \text{domain}(\text{fst}(N)).$ 
  ( $\langle t, m \rangle \in \text{snd}(N) \longrightarrow \text{fst}(N)m \in U$ ))))
```

One of the most important directed sets, is the neighborhoods of a point.

theorem (in topology0) directedset_neighborhoods:

```
assumes  $x \in \bigcup T$ 
defines Neigh  $\equiv \{U \in \text{Pow}(\bigcup T). x \in \text{int}(U)\}$ 
defines  $r \equiv \{\langle U, V \rangle \in (\text{Neigh} \times \text{Neigh}). V \subseteq U\}$ 
shows r directs Neigh
```

proof-

```

60.2 Filters

Nets are a generalization of sequences that can make us see that not all topological spaces can be described by sequences. Nevertheless, nets are not always the tool used to deal with convergence. The reason is that they make use of directed sets which are completely unrelated with the topology.

The topological tools to deal with convergence are what is called filters.

definition

```

IsFilter (_ {is a filter on} _ 90)
where  $\mathcal{F}$  {is a filter on}  $X \equiv (0 \notin \mathcal{F}) \wedge (X \in \mathcal{F}) \wedge (\mathcal{F} \subseteq \text{Pow}(X)) \wedge$ 
 $(\forall A \in \mathcal{F}. \forall B \in \mathcal{F}. A \cap B \in \mathcal{F}) \wedge (\forall B \in \mathcal{F}. \forall C \in \text{Pow}(X). B \subseteq C \longrightarrow C \in \mathcal{F})$ 

```

Not all the sets of a filter are needed to be consider at all times; as it happens with a topology we can consider bases.

definition

```

IsBaseFilter (_ {is a base filter} _ 90)
where  $C$  {is a base filter}  $\mathcal{F} \equiv C \subseteq \mathcal{F} \wedge \mathcal{F} = \{A \in \text{Pow}(\bigcup \mathcal{F}). (\exists D \in C. D \subseteq A)\}$ 

```

Not every set is a base for a filter, as it happens with topologies, there is a condition to be satisfied.

definition

```

SatisfiesFilterBase (_ {satisfies the filter base condition} 90)
where  $C$  {satisfies the filter base condition}  $\equiv (\forall A \in C. \forall B \in C. \exists D \in C. D \subseteq A \cap B) \wedge C \neq \emptyset \wedge \emptyset \notin C$ 

```

Every set of a filter contains a set from the filter's base.

lemma basic_element_filter:

```

  assumes  $A \in \mathcal{F}$  and  $C$  {is a base filter}  $\mathcal{F}$ 
  shows  $\exists D \in C. D \subseteq A$ 
proof-
  from assms(2) have  $t: \mathcal{F} = \{A \in \text{Pow}(\bigcup \mathcal{F}). (\exists D \in C. D \subseteq A)\}$  using IsBaseFilter_def
  by auto
  with assms(1) have  $A \in \{A \in \text{Pow}(\bigcup \mathcal{F}). (\exists D \in C. D \subseteq A)\}$  by auto
  then have  $A \in \text{Pow}(\bigcup \mathcal{F}) \ \exists D \in C. D \subseteq A$  by auto
  then show thesis by auto
qed

```

The following two results state that the filter base condition is necessary and sufficient for the filter generated by a base, to be an actual filter. The third result, rewrites the previous two.

```

60.3 Relation between nets and filters

In this section we show that filters do not generalize nets, but still nets and filter are in w way equivalent as far as convergence is considered.

Let's build now a net from a filter, such that both converge to the same points.

definition

$\text{NetOfFilter } (\text{Net } _) \text{ 40) where}$
 $\mathcal{F} \text{ \{is a filter on\} } \bigcup \mathcal{F} \implies \text{Net}(\mathcal{F}) \equiv$
 $\langle \{ \langle A, \text{fst}(A) \rangle. A \in \{ \langle x, F \rangle \in (\bigcup \mathcal{F}) \times \mathcal{F}. x \in F \} \}, \{ \langle A, B \rangle \in \{ \langle x, F \rangle \in (\bigcup \mathcal{F}) \times \mathcal{F}. x \in F \} \times \{ \langle x, F \rangle \in (\bigcup \mathcal{F}) \times \mathcal{F}. x \in F \}. \text{snd}(B) \subseteq \text{snd}(A) \} \} \rangle$

Net of a filter is indeed a net.

theorem `net_of_filter_is_net:`

`assumes \mathcal{F} \{is a filter on\} X`
`shows $(\text{Net}(\mathcal{F}))$ \{is a net on\} X`

The previous result states that, when considering convergence, the filters do not generalize nets. When considering a filter, there is always a net that

converges to the same points of the original filter.

Now we see that with nets, results come naturally applying the axiom of choice; but with filters, the results come, may be less natural, but with no choice. The reason is that $\text{Net}(\mathfrak{F})$ is a net that doesn't come into our attention as a first choice; maybe because we restrict ourselves to the anti-symmetry property of orders without realizing that a directed set is not an order.

The following results will state that filters are not just a subclass of nets, but that nets and filters are equivalent on convergence: for every filter there is a net converging to the same points, and also, for every net there is a filter converging to the same points.

definition

`FilterOfNet (Filter (_ .. _) 40) where`
`(N {is a net on} X) \implies Filter N..X \equiv {A \in Pow(X). $\exists D \in$ {fst(N)snd(s). s \in {s \in domain(fst(N)) \times domain(fst(N)). s \in snd(N) \wedge fst(s)=t0}}. t0 \in domain(fst(N))}. D \subseteq A}`

Filter of a net is indeed a filter

theorem filter_of_net_is_filter:

`assumes N {is a net on} X`
`shows (Filter N..X) {is a filter on} X and`
`{fst(N)snd(s). s \in {s \in domain(fst(N)) \times domain(fst(N)). s \in snd(N) \wedge fst(s)=t0}}. t0 \in domain(fst(N))} {is a base filter} (Filter N..X)`

proof -

`let C = {fst(N)(snd(s)). s \in {s \in domain(fst(N)) \times domain(fst(N)). s \in snd(N) \wedge fst(s)=t0}}. t0 \in domain(fst(N))}`
`have C \subseteq Pow(X)`
proof -
`{`
`fix t`
`assume t \in C`
`then obtain t1 where t1 \in domain(fst(N)) and`
`t_Def: t={fst(N)snd(s). s \in {s \in domain(fst(N)) \times domain(fst(N)). s \in snd(N) \wedge fst(s)=t1}}`
`by auto`
`{`
`fix x`
`assume x \in t`
`with t_Def obtain ss where ss \in {s \in domain(fst(N)) \times domain(fst(N)). s \in snd(N) \wedge fst(s)=t1} and`

We know now that filters and nets are the same thing, when working convergence of topological spaces. Sometimes, the nature of filters makes it easier to generalized them as follows.

Instead of considering all subsets of some set X , we can consider only open sets (we get an open filter) or closed sets (we get a closed filter). There are many more useful examples that characterize topological properties.

This type of generalization cannot be done with nets.

Also a filter can give us a topology in the following way:

```

theorem top_of_filter:
  assumes  $\mathcal{F}$  {is a filter on}  $\bigcup \mathcal{F}$ 
  shows  $(\mathcal{F} \cup \{0\})$  {is a topology}
proof -
  {
    fix A B
    assume  $A \in (\mathcal{F} \cup \{0\}) B \in (\mathcal{F} \cup \{0\})$ 
    then have  $(A \in \mathcal{F} \wedge B \in \mathcal{F}) \vee (A \cap B = 0)$  by auto
    with assms have  $A \cap B \in (\mathcal{F} \cup \{0\})$  unfolding IsFilter_def

61 Topology and neighborhoods

```
theory Topology_ZF_4a imports Topology_ZF_4
begin
```

This theory considers the relations between topology and systems of neighborhood filters.

61.1 Neighborhood systems

The standard way of defining a topological space is by specifying a collection of sets that we consider "open" (see the `Topology_ZF` theory). An alternative of this approach is to define a collection of neighborhoods for each point of the space.

We define a neighborhood system as a function that takes each point $x \in X$ and assigns it a collection of subsets of X which is called the neighborhoods of x . The neighborhoods of a point x form a filter that satisfies an additional axiom that for every neighborhood N of x we can find another one U such that N is a neighborhood of every point of U .

definition

```
IsNeighSystem (_ {is a neighborhood system on} _ 90)
  where  $\mathcal{M}$  {is a neighborhood system on}  $X \equiv (\mathcal{M} : X \rightarrow \text{Pow}(\text{Pow}(X))) \wedge$ 
     $(\forall x \in X. (\mathcal{M}(x) \text{ {is a filter on} } X) \wedge (\forall N \in \mathcal{M}(x). x \in N \wedge (\exists U \in \mathcal{M}(x). \forall y \in U. (N \in \mathcal{M}(y))$ 
    ) ) )
```

A neighborhood system on X consists of collections of subsets of X .

lemma neighborhood_subset:

```
  assumes  $\mathcal{M}$  {is a neighborhood system on}  $X$  and  $x \in X$  and  $N \in \mathcal{M}(x)$ 
  shows  $N \subseteq X$  and  $x \in N$ 
proof -
  from  $\langle \mathcal{M} \text{ {is a neighborhood system on} } X \rangle$  have  $\mathcal{M} : X \rightarrow \text{Pow}(\text{Pow}(X))$ 
    unfolding IsNeighSystem_def by simp
  with  $\langle x \in X \rangle$  have  $\mathcal{M}(x) \in \text{Pow}(\text{Pow}(X))$  using apply_funtype by blast
  with  $\langle N \in \mathcal{M}(x) \rangle$  show  $N \subseteq X$  by blast
  from assms show  $x \in N$  using IsNeighSystem_def by simp
qed
```

Some sources (like Wikipedia) use a bit different definition of neighborhood systems where the U is required to be contained in N . The next lemma shows that this stronger version can be recovered from our definition.

lemma neigh_def_stronger:

```
  assumes  $\mathcal{M}$  {is a neighborhood system on}  $X$  and  $x \in X$  and  $N \in \mathcal{M}(x)$ 
  shows  $\exists U \in \mathcal{M}(x). U \subseteq N \wedge (\forall y \in U. (N \in \mathcal{M}(y)))$ 
proof -
  from assms obtain  $W$  where  $W \in \mathcal{M}(x)$  and areNeigh:  $\forall y \in W. (N \in \mathcal{M}(y))$ 
    using IsNeighSystem_def by blast
```

```

let U = N ∩ W
from assms ⟨W ∈ M(x)⟩ have U ∈ M(x)
  unfolding IsNeighSystem_def IsFilter_def by blast
moreover have U ⊆ N by blast
moreover from areNeigh have ∀y ∈ U. (N ∈ M(y)) by auto
ultimately show thesis by auto
qed

```

61.2 Topology from neighborhood systems

Given a neighborhood system $\{\mathcal{M}_x\}_{x \in X}$ we can define a topology on X . Namely, we consider a subset of X open if $U \in \mathcal{M}_x$ for every element x of U .

The collection of sets defined as above is indeed a topology.

```

theorem topology_from_neighs:
  assumes M {is a neighborhood system on} X

61.3 Neighborhood system from topology

Once we have a topology T we can define a natural neighborhood system on $X = \bigcup T$. In this section we define such neighborhood system and prove its basic properties.

For a topology T we define a neighborhood system of T as a function that takes an $x \in X = \bigcup T$ and assigns it a collection supersets of open sets containing x . We call that the "neighborhood system of T "

definition

```

NeighSystem ({neighborhood system of} _ 91)
  where {neighborhood system of} T  $\equiv \{ \langle x, \{V \in \text{Pow}(\bigcup T). \exists U \in T. (x \in U \wedge U \subseteq V) \} \rangle. x \in \bigcup T \}$ 

```

The next lemma shows that open sets are members of (what we will prove later to be) the natural neighborhood system on $X = \bigcup T$.

```

lemma open_are_neighs:
  assumes  $U \in T$   $x \in U$ 
  shows  $x \in \bigcup T$  and  $U \in \{V \in \text{Pow}(\bigcup T). \exists U \in T. (x \in U \wedge U \subseteq V)\}$ 
  using assms by auto

```

Another fact we will need is that for every $x \in X = \bigcup T$ the neighborhoods of x form a filter

```

lemma neighs_is_filter:
  assumes  $T$  {is a topology} and  $x \in \bigcup T$ 
  defines Mdef:  $\mathcal{M} \equiv \{\text{neighborhood system of}\} T$ 
  shows  $\mathcal{M}(x)$  {is a filter on}  $(\bigcup T)$ 
proof -
  let  $X = \bigcup T$

62 Topology - examples

theory Topology_ZF_examples imports Topology_ZF Cardinal_ZF

begin

This theory deals with some concrete examples of topologies.

62.1 CoCardinal Topology

In this section we define and prove the basic properties of the co-cardinal topology on a set X .

The collection of subsets of a set whose complement is strictly bounded by a cardinal is a topology given some assumptions on the cardinal.

definition

$\text{CoCardinal}(X, T) \equiv \{F \in \text{Pow}(X) . X - F \prec T\} \cup \{0\}$

For any set and any infinite cardinal we prove that $\text{CoCardinal}(X, Q)$ forms a topology. The proof is done with an infinite cardinal, but it is obvious that the set Q can be any set equipollent with an infinite cardinal. It is a topology also if the set where the topology is defined is too small or the cardinal too large; in this case, as it is later proved the topology is a discrete topology. And the last case corresponds with $Q=1$ which translates in the indiscrete topology.

lemma CoCar_is_topology :

assumes $\text{InfCard } (Q)$

shows $\text{CoCardinal}(X, Q)$ {is a topology}

proof -

let $T = \text{CoCardinal}(X, Q)$

{

fix M

assume $A : M \in \text{Pow}(T)$

hence $M \subseteq T$ by auto

then have $M \subseteq \text{Pow}(X)$ using CoCardinal_def by auto

then have $\bigcup M \in \text{Pow}(X)$ by auto

moreover

{

assume $B : M = 0$

then have $\bigcup M \in T$ using CoCardinal_def by auto

}

moreover

{

assume $B : M = \{0\}$

then have $\bigcup M \in T$ using CoCardinal_def by auto

}

moreover

{

assume $B : M \neq 0 \wedge M \neq \{0\}$

from B obtain T where $C : T \in M$ and $T \neq 0$ by auto

with A have $D : X - T \prec (Q)$ using CoCardinal_def by auto

from C have $X - \bigcup M \subseteq X - T$ by blast

with D have $X - \bigcup M \prec (Q)$ using subset_imp_lepoll lesspoll_trans1

by blast

}

ultimately have $\bigcup M \in T$ using CoCardinal_def by auto

```

}
moreover
{
  fix U and V
  assume U∈T and V∈T
  then have A:U=0 ∨ (U∈Pow(X) ∧ X-U< (Q)) and
    B:V=0 ∨ (V∈Pow(X) ∧ X-V< (Q)) using CoCardinal_def by auto
  hence D:U∈Pow(X)V∈Pow(X) by auto
  have C:X-(U ∩ V)=(X-U)∪(X-V) by fast
  with A B C have U∩V=0∨(U∩V∈Pow(X) ∧ X-(U ∩ V)< (Q)) using less_less_imp_un_less
assms
  by auto
  then have U∩V∈T using CoCardinal_def by auto
}
ultimately show thesis using IsATopology_def by auto
qed

```

We can use theorems proven in `topology0` context for the co-cardinal topology.

```

theorem topology0_CoCardinal:
  assumes InfCard(T)
  shows topology0(CoCardinal(X,T))
  using topology0_def CoCar_is_topology assms by auto

```

It can also be proven that if $\text{CoCardinal}(X, T)$ is a topology, $X \neq 0$, $\text{Card}(T)$ and $T \neq 0$; then T is an infinite cardinal, $X < T$ or $T = 1$. It follows from the fact that the union of two closed sets is closed. Choosing the appropriate cardinals, the cofinite and the cocountable topologies are obtained.

The cofinite topology is a very special topology because it is closely related to the separation axiom T_1 . It also appears naturally in algebraic geometry.

definition

```

Cofinite (CoFinite _ 90) where
CoFinite X ≡ CoCardinal(X, nat)

```

Cocountable topology in fact consists of the empty set and all cocountable subsets of X .

definition

```

Cocountable (CoCountable _ 90) where
CoCountable X ≡ CoCardinal(X, csucc(nat))

```

62.2 Total set, Closed sets, Interior, Closure and Boundary

There are several assertions that can be done to the $\text{CoCardinal}(X, T)$ topology. In each case, we will not assume sufficient conditions for $\text{CoCardinal}(X, T)$ to be a topology, but they will be enough to do the calculations in every possible case.

The topology is defined in the set X

```

lemma union_cocardinal:
  assumes  $T \neq 0$ 
  shows  $\bigcup \text{CoCardinal}(X, T) = X$

62.6 Included Set Topology

In this section we consider the subsets of a set which contain a fixed set. The family defined in this section and the one in the previous section are dual; meaning that the closed set of one are the open sets of the other.

We define the included set topology as the collection of supersets of some fixed subset of the space X .

definition

$$\text{IncludedSet}(X, U) \equiv \{F \in \text{Pow}(X) . U \subseteq F\} \cup \{0\}$$

In the next theorem we prove that $\text{IncludedSet } X \ Q$ forms a topology.

theorem `includedset_is_topology`:

`shows IncludedSet(X, Q) {is a topology}`

proof-

```
{
  fix M
  assume M ∈ Pow(IncludedSet(X, Q))
  then have A: M ⊆ {F ∈ Pow(X) . Q ⊆ F} ∪ {0} using IncludedSet_def by auto
  then have ⋃ M ∈ Pow(X) by auto
  moreover
  have Q ⊆ ⋃ M ∨ ⋃ M = 0 using A by blast
  ultimately have ⋃ M ∈ IncludedSet(X, Q) using IncludedSet_def by auto
}
moreover
{
  fix U V
  assume U ∈ IncludedSet(X, Q) V ∈ IncludedSet(X, Q)
  then have U ∈ Pow(X) V ∈ Pow(X) U = 0 ∨ Q ⊆ U ∨ Q ⊆ V using IncludedSet_def
by auto
  then have U ∈ Pow(X) V ∈ Pow(X) (U ∩ V) = 0 ∨ Q ⊆ (U ∩ V) by auto
  then have (U ∩ V) ∈ IncludedSet(X, Q) using IncludedSet_def by auto
}
ultimately show thesis using IsATopology_def by auto
qed
```

We can reference the theorems proven in the `topology0` context when discussing the included set topology.

theorem `topology0_includedset`:

`shows topology0(IncludedSet(X, T))`

`using topology0_def includedset_is_topology by auto`

Choosing a singleton set, it is considered a point excluded topology. In the following lemmas and theorems, when necessary it will be considered that $T \neq 0$ and $T \subseteq X$. These cases will appear in the special cases section.

definition

`IncludedPoint (IncludedPoint _ _ 90) where`

`IncludedPoint X p ≡ IncludedSet(X, {p})`

62.7 Basic topological notions in included set topology

This section discusses total set, closed sets, interior, closure and boundary for included set topology.

The topology is defined in the set X .

```
lemma union_includedset:
  assumes  $T \subseteq X$

62.8 Special cases and subspaces

In this section we discuss some corner cases when some parameters in our definitions are empty and provide some facts about subspaces in included set topologies.

The topology is discrete if $T=0$

```
lemma smaller_includedset:
  shows IncludedSet(X,0) = Pow(X)
proof
  show IncludedSet(X,0)  $\subseteq$  Pow(X) and Pow(X)  $\subseteq$  IncludedSet(X,0)
    unfolding IncludedSet_def by auto
qed
```

If the set which is included is not a subset of X , then the topology is trivial.

```
lemma empty_includedset:
  assumes  $\sim(T \subseteq X)$ 
  shows IncludedSet(X,T) = {0}
proof
  from assms show IncludedSet(X,T)  $\subseteq$  {0} and {0}  $\subseteq$  IncludedSet(X,T)
    unfolding IncludedSet_def by auto
qed
```

The topological subspaces of the $\text{IncludedSet}(X,T)$ topology are also IncludedSet topologies. The trivial case does not fit the idea in the demonstration because if $Y \subseteq X$ then $\text{IncludedSet}(Y \cap X, Y \cap T)$ is never trivial. There is no need for a separate proof because the only subspace of the trivial topology is itself.

```
lemma subspace_includedset:
  assumes  $T \subseteq X$ 
  shows IncludedSet(X,T) {restricted to} Y = IncludedSet( $Y \cap X, Y \cap T$ )
proof
  {
    fix M
    assume  $M \in (\text{IncludedSet}(X,T) \text{ {restricted to} } Y)$ 
    then obtain A where  $A1:A:\text{IncludedSet}(X,T)$   $M = Y \cap A$  unfolding RestrictedTo_def

```

In this theory file we reformulate the concepts related to a topology in relation with a base of the topology and we give examples of topologies defined by bases or subbases.

63.1 New ideas using a base for a topology

63.2 The topology of a base

Given a family of subsets satisfying the base condition, it is possible to construct a topology where that family is a base of. Even more, it is the only topology with such characteristics.

definition

TopologyWithBase (TopologyBase _ 50) **where**
 $U \text{ \{satisfies the base condition\} } \implies \text{TopologyBase } U \equiv \text{THE } T. U \text{ \{is a base for\} } T$

If a collection U of sets satisfies the base condition then the topology constructed from it is indeed a topology and U is a base for this topology.

theorem Base_topology_is_a_topology:

assumes $U \text{ \{satisfies the base condition\} }$
shows $(\text{TopologyBase } U) \text{ \{is a topology\} }$ **and** $U \text{ \{is a base for\} } (\text{TopologyBase } U)$

proof-

from **assms** **obtain** T **where** $U \text{ \{is a base for\} } T$ **using**
 Top_1_2_T1(2) **by** **blast**
then **have** $\exists ! T. U \text{ \{is a base for\} } T$ **using** $\text{same_base_same_top ex1I[where}$
 $P =$
 $\lambda T. U \text{ \{is a base for\} } T]$ **by** **blast**
with **assms** **show** $U \text{ \{is a base for\} } (\text{TopologyBase } U)$ **using** theI[where
 $P =$
 $\lambda T. U \text{ \{is a base for\} } T]$ $\text{TopologyWithBase_def}$ **by** **auto**
with **assms** **show** $(\text{TopologyBase } U) \text{ \{is a topology\} }$ **using** Top_1_2_T1(1)
 IsAbaseFor_def **by** **auto**
qed

A base doesn't need the empty set.

lemma base_no_0:

shows $B \text{ \{is a base for\} } T \longleftrightarrow (B - \{0\}) \text{ \{is a base for\} } T$

proof-

{
fix M
assume $M \in \{\bigcup A . A \in \text{Pow}(B)\}$
then **obtain** Q **where** $M = \bigcup Q Q \in \text{Pow}(B)$ **by** **auto**
hence $M = \bigcup (Q - \{0\}) Q - \{0\} \in \text{Pow}(B - \{0\})$ **by** **auto**
hence $M \in \{\bigcup A . A \in \text{Pow}(B - \{0\})\}$ **by** **auto**
}
hence $\{\bigcup A . A \in \text{Pow}(B)\} \subseteq \{\bigcup A . A \in \text{Pow}(B - \{0\})\}$ **by** **blast**
moreover
{
fix M
assume $M \in \{\bigcup A . A \in \text{Pow}(B - \{0\})\}$
then **obtain** Q **where** $M = \bigcup Q Q \in \text{Pow}(B - \{0\})$ **by** **auto**
hence $M = \bigcup (Q) Q \in \text{Pow}(B)$ **by** **auto**

```

    hence  $M \in \{\bigcup A . A \in \text{Pow}(B)\}$  by auto
  }
  hence  $\{\bigcup A . A \in \text{Pow}(B - \{0\})\} \subseteq \{\bigcup A . A \in \text{Pow}(B)\}$ 
    by auto
  ultimately have  $\{\bigcup A . A \in \text{Pow}(B - \{0\})\} = \{\bigcup A . A \in \text{Pow}(B)\}$  by auto
  then show  $B\{\text{is a base for}\}T \longleftrightarrow (B-\{0\})\{\text{is a base for}\}T$  using IsAbaseFor_def
by auto
qed

```

The interior of a set is the union of all the sets of the base which are fully contained by it.

```

lemma interior_set_base_topology:
  assumes U {is a base for} T T{is a topology}
  shows  $\text{Interior}(A,T) = \bigcup \{T \in U. T \subseteq A\}$ 
proof
  have  $\{T \in U. T \subseteq A\} \subseteq U$  by auto
  with assms(1) have  $\bigcup \{T \in U. T \subseteq A\} \in T$ 
    using IsAbaseFor_def by auto
  moreover have  $\bigcup \{T \in U. T \subseteq A\} \subseteq A$  by blast
  ultimately show  $\bigcup \{T \in U. T \subseteq A\} \subseteq \text{Interior}(A,T)$ 
    using assms(2) topology0.Top_2_L5 topology0_def by auto
  {
    fix x
    assume  $x \in \text{Interior}(A,T)$ 
    with assms obtain V where  $V \in U$   $V \subseteq \text{Interior}(A,T)$   $x \in V$

 qed

We have already seen for a base that whenever there is a union of open sets, we can consider only basic open sets due to the fact that any open set is a union of basic open sets. What we should expect now is that when there is

an intersection of closed sets, we can consider only dual basic closed sets.

lemma closure_dual_base:

assumes U {is a base for} Q Q {is a topology} $A \subseteq \bigcup Q$

shows $\text{Closure}(A, Q) = \bigcap \{T \in \text{DualBase } U \ Q. \ A \subseteq T\}$

proof

from assms(1) have $T: \bigcup Q \in \text{DualBase } U \ Q$ using DualBase_def by auto

moreover

{

fix T

assume $A: T \in \text{DualBase } U \ Q \ A \subseteq T$

with assms(1) obtain R where $(T = \bigcup Q - R \wedge R \in U) \vee T = \bigcup Q$ using DualBase_def

by auto

with A(2) assms(1,2) have $(T \{\text{is closed in } Q\}) A \subseteq T \in \text{Pow}(\bigcup Q)$ using

topology0.Top_3_L1 topology0_def

topology0.Top_3_L9 base_sets_open by auto

}

then have $\text{SUB}: \{T \in \text{DualBase } U \ Q. \ A \subseteq T\} \subseteq \{T \in \text{Pow}(\bigcup Q). \ (T \{\text{is closed in } Q\}) \wedge A \subseteq T\}$

by blast

with calculation assms(3) have $\bigcap \{T \in \text{Pow}(\bigcup Q). \ (T \{\text{is closed in } Q\}) \wedge A \subseteq T\} \subseteq \bigcap \{T \in \text{DualBase } U \ Q. \ A \subseteq T\}$

by auto

thus $\bigcap \{T \in \text{DualBase } U \ Q. \ A \subseteq T\} \subseteq \text{Closure}(A, Q)$ by auto

qed

63.4 Partition topology

In the theory file `Partitions_ZF.thy`; there is a definition to work with partitions. In this setting is much easier to work with a family of subsets.

definition

`IsAPartition (_{is a partition of}_ 90) where`
`(U {is a partition of} X) \equiv ($\bigcup U = X \wedge (\forall A \in U. \forall B \in U. A = B \vee A \cap B = \emptyset) \wedge \emptyset \notin U$)`

A subcollection of a partition is a partition of its union.

lemma `subpartition:`

`assumes U {is a partition of} X $V \subseteq U$`
`shows V {is a partition of} $\bigcup V$`
`using assms unfolding IsAPartition_def by auto`

A restriction of a partition is a partition. If the empty set appears it has to be removed.

lemma `restriction_partition:`

`assumes U {is a partition of} X`
`shows ((U {restricted to} Y) - { \emptyset }) {is a partition of} (X \cap Y)`
`using assms unfolding IsAPartition_def RestrictedTo_def`
`by fast`

Given a partition, the complement of a union of a subfamily is a union of a subfamily.

lemma `diff_union_is_union_diff:`

`assumes $R \subseteq P$ P {is a partition of} X`
`shows $X - \bigcup R = \bigcup (P - R)$`

proof

```
{
  fix x
  assume  $x \in X - \bigcup R$ 
  hence  $P : x \in X \wedge x \notin \bigcup R$  by auto
  {
    fix T
    assume  $T \in R$ 
    with P(2) have  $x \notin T$  by auto
  }
  with P(1) assms(2) obtain Q where  $Q \in (P - R) \wedge x \in Q$  using IsAPartition_def
by auto
  hence  $x \in \bigcup (P - R)$  by auto
}
thus  $X - \bigcup R \subseteq \bigcup (P - R)$  by auto
{
  fix x
  assume  $x \in \bigcup (P - R)$ 
  then obtain Q where  $Q \in P - R \wedge x \in Q$  by auto
```

```

hence C:  $Q \in P \rightarrow Q \notin R \rightarrow x \in Q$  by auto
then have  $x \in \bigcup P$  by auto
with assms(2) have  $x \in X$  using IsAPartition_def by auto
moreover
{
  assume  $x \in \bigcup R$ 
  then obtain t where  $G: t \in R$   $x \in t$  by auto
  with C(3) assms(1) have  $t \cap Q \neq \emptyset \rightarrow t \in P$  by auto
  with assms(2) C(1,3) have  $t = Q$  using IsAPartition_def
    by blast
  with C(2) G(1) have False by auto
}
hence  $x \notin \bigcup R$  by auto
ultimately have  $x \in X - \bigcup R$  by auto
}
thus  $\bigcup (P - R) \subseteq X - \bigcup R$  by auto
qed

```

63.5 Partition topology is a topology.

A partition satisfies the base condition.

```

lemma partition_base_condition:
  assumes P {is a partition of} X
  shows P {satisfies the base condition}

```

proof-

```

{
  fix U V
  assume AS:  $U \in P \wedge V \in P$ 
  with assms have A:  $U = V \vee U \cap V = \emptyset$  using IsAPartition_def by auto
  {
    fix x
    assume ASS:  $x \in U \cap V$ 
    with A have  $U = V$  by auto
    with AS ASS have  $U \in P \wedge x \in U \wedge U \subseteq U \cap V$  by auto
    hence  $\exists W \in P. x \in W \wedge W \subseteq U \cap V$  by auto
  }
  hence  $(\forall x \in U \cap V. \exists W \in P. x \in W \wedge W \subseteq U \cap V)$  by auto
}
then show thesis using SatisfiesBaseCondition_def by auto
qed

```

Since a partition is a base of a topology, and this topology is uniquely determined; we can built it. In the definition we have to make sure that we have a partition.

definition

```

PartitionTopology (PTopology _ _ 50) where
  (U {is a partition of} X)  $\implies$  PTopology X U  $\equiv$  TopologyBase U

```

```

63.8 Order topologies

63.9 Order topology is a topology

Given a totally ordered set, several topologies can be defined using the order relation. First we define an open interval, notice that the set defined as Interval is a closed interval; and open rays.

definition

IntervalX where

IntervalX(X,r,b,c)≡(Interval(r,b,c)∩X)-{b,c}

definition

LeftRayX where

LeftRayX(X,r,b)≡{c∈X. ⟨c,b⟩∈r}-{b}

definition

RightRayX where

RightRayX(X,r,b)≡{c∈X. ⟨b,c⟩∈r}-{b}

qed
```

The interior, closure and boundary can be calculated using the formulas proved in the section that deals with the base.

The subspace of an order topology doesn't have to be an order topology.

63.11 Right order and Left order topologies.

Notice that the left and right rays are closed under intersection, hence they form a base of a topology. They are called right order topology and left order topology respectively.

If the order in X has a minimal or a maximal element, is necessary to consider X as an element of the base or that limit point wouldn't be in any basic open set.

63.11.1 Right and Left Order topologies are topologies

63.12 Union of Topologies

The union of two topologies is not a topology. A way to overcome this fact is to define the following topology:

definition

joinT (joinT _ 90) where
 $(\forall T \in M. T \text{ is a topology}) \wedge (\forall Q \in M. \bigcup Q = \bigcup T) \implies (\text{joinT } M \equiv \text{THE } T. (\bigcup M) \text{ is a subbase for } T)$

First let's proof that given a family of sets, then it is a subbase for a topology.

The first result states that from any family of sets we get a base using finite intersections of them. The second one states that any family of sets is a subbase of some topology.

theorem subset_as_subbase:

shows $\{\bigcap A. A \in \text{FinPow}(B)\}$ {satisfies the base condition}

proof-

```
{
  fix U V
  assume A:U∈{⋂ A. A ∈ FinPow(B)} ∧ V∈{⋂ A. A ∈ FinPow(B)}

64 Properties in Topology

theory Topology_ZF_properties imports Topology_ZF_examples Topology_ZF_examples_1

begin

This theory deals with topological properties which make use of cardinals.

64.1 Properties of compactness

It is already defined what is a compact topological space, but the is a generalization which may be useful sometimes.

definition

```

IsCompactOfCard (_{is compact of cardinal}_ {in}_ 90)
where K{is compact of cardinal} Q{in}T  $\equiv$  (Card(Q)  $\wedge$   $K \subseteq \bigcup T \wedge$ 
 $(\forall M \in \text{Pow}(T). K \subseteq \bigcup M \longrightarrow (\exists N \in \text{Pow}(M). K \subseteq \bigcup N \wedge N \prec Q))$ )

```

The usual compact property is the one defined over the cardinal of the natural numbers.

```

lemma Compact_is_card_nat:
  shows K{is compact in}T  $\longleftrightarrow$  (K{is compact of cardinal} nat {in}T)
proof
  {
    assume K{is compact in}T
    then have sub:  $K \subseteq \bigcup T$  and reg:  $(\forall M \in \text{Pow}(T). K \subseteq \bigcup M \longrightarrow (\exists N \in$ 
FinPow(M).  $K \subseteq \bigcup N))$ 
    using IsCompact_def by auto
    {
      fix M
      assume  $M \in \text{Pow}(T) \wedge K \subseteq \bigcup M$ 
      with reg obtain N where  $N \in \text{FinPow}(M) \wedge K \subseteq \bigcup N$  by blast
      then have Finite(N) using FinPow_def by auto
      then obtain n where  $A: n \in \text{nat} \wedge N \approx n$  using Finite_def by auto
      from A(1) have  $n \prec \text{nat}$  using n_lesspoll_nat by auto
      with A(2) have  $N \lesssim \text{nat}$  using lesspoll_def eq_lepoll_trans by auto
      moreover
      {
        assume  $N \approx \text{nat}$ 
        then have  $\text{nat} \approx N$  using eqpoll_sym by auto
        with A(2) have  $\text{nat} \approx n$  using eqpoll_trans by blast
        then have  $n \approx \text{nat}$  using eqpoll_sym by auto
        with  $n \prec \text{nat}$  have False using lesspoll_def by auto
      }
      then have  $\sim(N \approx \text{nat})$  by auto
      with calculation  $\langle K \subseteq \bigcup N \rangle \langle N \in \text{FinPow}(M) \rangle$  have  $N \prec \text{nat} \wedge K \subseteq \bigcup N \wedge N \in \text{Pow}(M)$  us-
ing lesspoll_def
      FinPow_def by auto
      hence  $(\exists N \in \text{Pow}(M). K \subseteq \bigcup N \wedge N \prec \text{nat})$  by auto
    }
    with sub show K{is compact of cardinal} nat {in}T using IsCompactOfCard_def
Card_nat by auto
  }
  {
    assume (K{is compact of cardinal} nat {in}T)
    then have sub:  $K \subseteq \bigcup T$  and reg:  $(\forall M \in \text{Pow}(T). K \subseteq \bigcup M \longrightarrow (\exists N \in \text{Pow}(M). K \subseteq \bigcup N \wedge N \prec \text{nat}))$ 
    using IsCompactOfCard_def by auto
    {
      fix M
      assume  $M \in \text{Pow}(T) \wedge K \subseteq \bigcup M$ 
      with reg have  $(\exists N \in \text{Pow}(M). K \subseteq \bigcup N \wedge N \prec \text{nat})$  by auto
      then obtain N where  $N \in \text{Pow}(M) \wedge K \subseteq \bigcup N \wedge N \prec \text{nat}$  by blast
    }
  }
}

```

```

      then have  $N \in \text{FinPow}(M) \cdot K \subseteq \bigcup N$  using lesspoll_nat_is_Finite FinPow_def
    by auto
      hence  $\exists N \in \text{FinPow}(M) \cdot K \subseteq \bigcup N$  by auto
    }
    with sub show  $K \{\text{is compact in}\} T$  using IsCompact_def by auto
  }
qed

```

Another property of this kind widely used is the Lindelof property; it is the one on the successor of the natural numbers.

definition

```

  IsLindelof ( $\_ \{\text{is lindelof in}\} \_$  90) where
   $K \{\text{is lindelof in}\} T \equiv K \{\text{is compact of cardinal}\} \text{csucc}(\text{nat})\{\text{in}\} T$ 

```

It would be natural to think that every countable set with any topology is Lindelof; but this statement is not provable in ZF. The reason is that to build a subcover, most of the time we need to *choose* sets from an infinite collection which cannot be done in ZF. Additional axioms are needed, but strictly weaker than the axiom of choice.

However, if the topology has not many open sets, then the topological space is indeed compact.

```

theorem card_top_comp:
  assumes  $\text{Card}(Q) \cdot T \prec Q \cdot K \subseteq \bigcup T$ 
  shows  $(K) \{\text{is compact of cardinal}\} Q \{\text{in}\} T$ 
proof-
  {
    fix M assume  $M : M \subseteq T \cdot K \subseteq \bigcup M$ 
    from M(1) assms(2) have  $M \prec Q$  using subset_imp_lepoll lesspoll_trans1

64.3 Relations between numerability properties and choice principles

It is known that some statements in topology aren't just derived from choice axioms, but also equivalent to them. Here is an example

The following are equivalent:

- Every topological space of second cardinality $\text{csucc}(Q)$ is separable of cardinality $\text{csucc}(Q)$.
- The axiom of Q choice.

In the article [4] there is a proof of this statement for $Q = \mathbb{N}$, with more equivalences.

If a topology is of second type of cardinal $\text{csucc}(Q)$, then it is separable of the same cardinal. This result makes use of the axiom of choice for the cardinal Q on subsets of $\bigcup T$.

```

theorem Q_choice_imp_second_imp_separable:
  assumes T{is of second type of cardinal}csucc(Q)
    and {the axiom of} Q {choice holds for subsets}  $\bigcup T$ 
    and T{is a topology}
  shows T{is separable of cardinal}csucc(Q)

This results make easy to check if a space is T_2 .

The topology which comes from a filter as in $\mathfrak{F} \text{ \{is a filter on\} } \bigcup \mathfrak{F} \implies (\mathfrak{F} \cup \{0\}) \text{ \{is a topology\}}$ is not T_2 generally. We will see in this file later on, that the exceptions are a consequence of the spectrum.

```

65.3 Spectrum and anti-properties

The spectrum of a topological property is a class of sets such that all topologies defined over that set have that property.

The spectrum of a property gives us the list of sets for which the property doesn't give any topological information. Being in the spectrum of a topological property is an invariant in the category of sets and function; meaning that equipollent sets are in the same spectra.

definition $\text{Spec } (_ \text{ \{is in the spectrum of\} } _ \ 99)$
where $\text{Spec}(K,P) \equiv \forall T. ((T\{\text{is a topology}\} \wedge \bigcup T \approx K) \longrightarrow P(T))$

qed

From the previous statement, we see that the spectrum could be formed only by representative of classes of sets. If AC holds, this means that the spectrum can be taken as a set or class of cardinal numbers.

Here is an example of the spectrum. The proof lies in the indiscrete filter $\{A\}$ that can be build for any set. In this proof, we see that without choice, there is no way to define the spectrum of a property with cardinals because if a set is not comparable with any ordinal, its cardinal is defined as 0 without the set being empty.

theorem T4_spectrum :

qed

This last theorem states that if one of the forms of the axiom of choice related to this compactness property fails, then the spectrum will be different. Notice that even for Lindelöf spaces that will happend.

The spectrum gives us the possibility to define what an anti-property means. A space is anti- P if the only subspaces which have the property are the ones in the spectrum of P . This concept tries to put together spaces that are completely opposite to spaces where $P(T)$.

definition

antiProperty ($_ \{\text{is anti-}\} _ 50$)

where $T \{\text{is anti-}\} P \equiv \forall A \in Pow(\bigcup T). P(T \{\text{restricted to}\} A) \longrightarrow (A \{\text{is in the spectrum of}\} P)$

abbreviation

ANTI(P) $\equiv \lambda T. (T \{\text{is anti-}\} P)$

A first, very simple, but very useful result is the following: when the properties are related and the spectra are equal, then the anti-properties are related in the opposite direction.

theorem (in topology0) eq_spect_rev_imp_anti:

assumes $\forall T. T \{\text{is a topology}\} \longrightarrow P(T) \longrightarrow Q(T) \forall A. (A \{\text{is in the spectrum of}\} Q) \longrightarrow (A \{\text{is in the spectrum of}\} P)$

and $T \{\text{is anti-}\} Q$

shows $T \{\text{is anti-}\} P$

```

proof-

The conclusion is that being T_0 is just the opposite to being indiscrete.

Next, let's compute the anti- T_i for $i = 1, 2, 3$ or 4 . Surprisingly, they are all the same. Meaning, that the total negation of T_1 is enough to negate all of these axioms.

theorem anti_T1:

shows $(T \{is\ anti-\} isT1) \longleftrightarrow (IsLinOrder(T, \{\langle U, V \rangle \in Pow(\bigcup T) \times Pow(\bigcup T). U \subseteq V\}))$

```

In conclusion, T_1 is also an anti-property.

Let's define some anti-properties that we'll use in the future.

definition

```

IsAntiComp (_{is anti-compact})
where  $T\{\text{is anti-compact}\} \equiv T\{\text{is anti-}\}(\lambda T. (\bigcup T)\{\text{is compact in}\}T)$ 

```

definition

```

IsAntiLin (_{is anti-lindeloeff})
where  $T\{\text{is anti-lindeloeff}\} \equiv T\{\text{is anti-}\}(\lambda T. ((\bigcup T)\{\text{is lindeloeff in}\}T))$ 

```

Anti-compact spaces are also called pseudo-finite spaces in literature before the concept of anti-property was defined.

end

66 Topology 6

```
theory Topology_ZF_6 imports Topology_ZF_4 Topology_ZF_2 Topology_ZF_1
```

begin

This theory deals with the relations between continuous functions and convergence of filters. At the end of the file there some results about the building of functions in cartesian products.

66.1 Image filter

First of all, we will define the appropriate tools to work with functions and filters together.

We define the image filter as the collections of supersets of of images of sets from a filter.

definition

```
ImageFilter (_[_].._ 98)
  where  $\mathfrak{F}$  {is a filter on}  $X \implies f:X \rightarrow Y \implies f[\mathfrak{F}]..Y \equiv \{A \in \text{Pow}(Y). \exists D \in \{f(B) \mid B \in \mathfrak{F}\}. D \subseteq A\}$ 
```

Note that in the previous definition, it is necessary to state Y as the final set because f is also a function to every superset of its range. X can be changed by $\text{domain}(f)$ without any change in the definition.

lemma base_image_filter:

```
  assumes  $\mathfrak{F}$  {is a filter on}  $X$   $f:X \rightarrow Y$ 
  shows  $\{fB \mid B \in \mathfrak{F}\}$  {is a base filter}  $(f[\mathfrak{F}]..Y)$  and  $(f[\mathfrak{F}]..Y)$  {is a filter on}  $Y$ 
```

proof-

```
{
  assume  $0 \in \{fB \mid B \in \mathfrak{F}\}$ 
  then obtain B where  $B \in \mathfrak{F}$  and  $f_B:fB=0$  by auto

In the following results we will show that anti-hyperconnectedness is a separation property between T_1 and T_2 . We will show also that both implications are proper.

First, the closure of a point in every topological space is always hyperconnected. This is the reason why every anti-hyperconnected space must be T_1 : every singleton must be closed.

lemma (in topology0) cl_point_imp_HConn:

assumes $x \in \bigcup T$

shows $(T \text{ restricted to } \text{Closure}(\{x\}, T)) \text{ is hyperconnected}$

proof-

from assms have $\text{sub} : \text{Closure}(\{x\}, T) \subseteq \bigcup T$ using Top_3_L11 by auto

then have $\text{tot} : \bigcup (T \text{ restricted to } \text{Closure}(\{x\}, T)) = \text{Closure}(\{x\}, T)$ unfolding RestrictedTo_def by auto

{

fix A B

assume $AS : A \in (T \text{ restricted to } \text{Closure}(\{x\}, T)) B \in (T \text{ restricted to } \text{Closure}(\{x\}, T)) A \cap B = 0$

then have $B \subseteq \bigcup ((T \text{ restricted to } \text{Closure}(\{x\}, T))) A \subseteq \bigcup ((T \text{ restricted to } \text{Closure}(\{x\}, T)))$

by auto

with tot have $B \subseteq \text{Closure}(\{x\}, T) A \subseteq \text{Closure}(\{x\}, T)$ by auto

from $AS(1,2)$ obtain UA UB where $UA \cup B : UA \in T \cup B \in T A = UA \cap \text{Closure}(\{x\}, T) B = UB \cap \text{Closure}(\{x\}, T)$

unfolding RestrictedTo_def by auto

then have $\text{Closure}(\{x\}, T) - A = \text{Closure}(\{x\}, T) - (UA \cap \text{Closure}(\{x\}, T)) \text{ Closure}(\{x\}, T) - B = \text{Closure}(\{x\}, T) - (UB \cap \text{Closure}(\{x\}, T))$

by auto

then have $\text{Closure}(\{x\}, T) - A = \text{Closure}(\{x\}, T) - (UA) \text{ Closure}(\{x\}, T) - B = \text{Closure}(\{x\}, T) - (UB)$

by auto

with sub have $\text{Closure}(\{x\}, T) - A = \text{Closure}(\{x\}, T) \cap (\bigcup T - UA) \text{ Closure}(\{x\}, T) - B = \text{Closure}(\{x\}, T) \cap (\bigcup T - UB)$

by auto

moreover

from $UA \cup B$ have $(\bigcup T - UA) \text{ is closed in } T (\bigcup T - UB) \text{ is closed in } T$ us-

Let's show that anti-hyperconnected is in fact T_1 and sober. The trick of the proof lies in the fact that if a subset is hyperconnected, its closure is so too (the closure of a point is then always hyperconnected because singletons are in the spectrum); since the closure is closed, we can apply the sober property on it.

```

theory Topology_ZF_8 imports Topology_ZF_6 EquivClass1
begin

```

This theory deals with quotient topologies.

68.1 Definition of quotient topology

Given a surjective function $f : X \rightarrow Y$ and a topology τ in X , it is possible to consider a special topology in Y . f is called quotient function.

```

definition(in topology0)
  QuotientTop ({quotient topology in}_{by}_ 80)
  where f∈surj(⋃T,Y) ⇒{quotient topology in}Y{by}f≡
    {U∈Pow(Y). f-U∈T}

```

```

abbreviation QuotientTopTop ({quotient topology in}_{by}_{from}_)
  where QuotientTopTop(Y,f,T) ≡ topology0.QuotientTop(T,Y,f)

```

The quotient topology is indeed a topology.

```

theorem(in topology0) quotientTop_is_top:
  assumes f∈surj(⋃T,Y)
  shows ({quotient topology in} Y {by} f) {is a topology}
proof-
  have ({quotient topology in} Y {by} f)={U ∈ Pow(Y) . f - U ∈ T} using

```

68.2 Quotient topologies from equivalence relations

In this section we will show that the quotient topologies come from an equivalence relation.

First, some lemmas for relations.

```

lemma quotient_proj_fun:
  shows {<b,r{b}>}. b∈A}:A→A//r unfolding Pi_def function_def domain_def
unfolding quotient_def by auto

```

```

lemma quotient_proj_surj:
  shows {<b,r{b}>}. b∈A}∈surj(A,A//r)
proof-
{
  fix y assume y∈A//r
  then obtain yy where A:yy∈A y=r{yy} unfolding quotient_def by auto
  then have <yy,y>∈{<b,r{b}>}. b∈A} by auto
  then have {<b,r{b}>}. b∈A}yy=y using apply_equality[OF _ quotient_proj_fun]
by auto
  with A(1) have  $\exists yy \in A. \{<b,r\{b\}>. b \in A\}yy = y$  by auto
}
with quotient_proj_fun show thesis unfolding surj_def by auto
qed

```

```

lemma preim_equi_proj:
  assumes  $U \subseteq A//r$  equiv(A,r)
  shows {<b,r{b}>}. b∈A}-U= $\bigcup U$ 

```

```

proof
{
  fix y assume y ∈ ⋃ U
  then obtain V where V: y ∈ V V ∈ U by auto
  with ⟨U ⊆ (A//r)⟩ have y ∈ A using EquivClass_1_L1 assms(2) by auto more-
over
  from ⟨U ⊆ (A//r)⟩ V have r{y} = V using EquivClass_1_L2 assms(2) by auto
  moreover note V(2) ultimately have y ∈ {x ∈ A. r{x} ∈ U} by auto
  then have y ∈ {⟨b, r{b}⟩. b ∈ A} - U by auto
}
then show ⋃ U ⊆ {⟨b, r{b}⟩. b ∈ A} - U by blast moreover
{
  fix y assume y ∈ {⟨b, r{b}⟩. b ∈ A} - U
  then have yy: y ∈ {x ∈ A. r{x} ∈ U} by auto
  then have r{y} ∈ U by auto moreover
  from yy have y ∈ r{y} using assms equiv_class_self by auto ultimately
  have y ∈ ⋃ U by auto
}
then show {⟨b, r{b}⟩. b ∈ A} - U ⊆ ⋃ U by blast
qed

```

Now we define what a quotient topology from an equivalence relation is:

```

definition(in topology0)
  EquivQuo ({quotient by}_ 70)
  where equiv(⋃ T, r) ⇒ ({quotient by}_ r) ≡ {quotient topology in}(⋃ T) // r {by} {⟨b, r{b}⟩.
b ∈ ⋃ T}

```

abbreviation

```

EquivQuoTop (_{quotient by}_ 60)
where EquivQuoTop(T, r) ≡ topology0.EquivQuo(T, r)

```

First, another description of the topology (more intuitive):

theorem (in topology0) quotient_equiv_rel:

```

  assumes equiv(⋃ T, r)
  shows ({quotient by}_ r) = {U ∈ Pow((⋃ T) // r). ⋃ U ∈ T}

```

proof-

```

69.1 Group of homeomorphisms

This theory file deals with the fact the set homeomorphisms of a topological space into itself forms a group.

First, we define the set of homeomorphisms.

definition

$$\text{HomeoG}(T) \equiv \{f: \bigcup T \rightarrow \bigcup T. \text{IsAhomeomorphism}(T, T, f)\}$$

The homeomorphisms are closed by composition.

lemma (in topology0) homeo_composition:

```

  assumes f∈HomeoG(T)g∈HomeoG(T)
  shows Composition(⋃T)⟨f, g⟩∈HomeoG(T)

```

proof-

```

    from assms have fun:  $f \in \bigcup T \rightarrow \bigcup T$   $g \in \bigcup T \rightarrow \bigcup T$  and homeo: IsAhomeomorphism( $T, T, f$ ) IsAhomeomorphism( $T, T, g$ )
  unfolding HomeoG_def
    by auto
    from fun have f 0  $g \in \bigcup T \rightarrow \bigcup T$  using comp_fun by auto moreover
    from homeo have bij:  $f \in \text{bij}(\bigcup T, \bigcup T)$   $g \in \text{bij}(\bigcup T, \bigcup T)$  and cont: IsContinuous( $T, T, f$ ) IsContinuous( $T, T, g$ )
  and contconv:
    IsContinuous( $T, T, \text{converse}(f)$ ) IsContinuous( $T, T, \text{converse}(g)$ )
  unfolding IsAhomeomorphism_def by auto
    from bij have f 0  $g \in \text{bij}(\bigcup T, \bigcup T)$  using comp_bij by auto moreover
    from cont have IsContinuous( $T, T, f$  0  $g$ ) using comp_cont by auto moreover
  over

```

Every continuous function from a space which has some property P and a

space which has the property $\text{anti}(P)$, given that this property is preserved by continuous functions, it follows that the range of the function is in the spectrum. Applied to connectedness, it follows that continuous functions from a connected space to a totally-disconnected one are constant.

```

71 Topology 11

theory Topology_ZF_11 **imports** Topology_ZF_7 Finite_ZF_1

begin

This file deals with order topologies. The order topology is already defined in Topology_ZF_examples_1.thy.

71.1 Order topologies

We will assume most of the time that the ordered set has more than one point. It is natural to think that the topological properties can be translated to properties of the order; since every order rises one and only one topology in a set.

71.2 Separation properties

Order topologies have a lot of separation properties.

Every order topology is Hausdorff.

theorem order_top_T2:

assumes IsLinOrder(X,r) $\exists x y. x \neq y \wedge x \in X \wedge y \in X$

shows (OrdTopology X r){is T₂}

proof-

Every order topology is T_4 , but the proof needs lots of machinery. At the end of the file, we will prove that every order topology is normal; sooner or later.

71.3 Connectedness properties

Connectedness is related to two properties of orders: completeness and density

Some order-dense properties:

definition

IsDenseSub ($_ \{ \text{is dense in } _ \text{with respect to } _ \}$) where
 $A \{ \text{is dense in } X \text{with respect to } r \} \equiv$
 $\forall x \in X. \forall y \in X. \langle x, y \rangle \in r \wedge x \neq y \longrightarrow (\exists z \in A - \{x, y\}. \langle x, z \rangle \in r \wedge \langle z, y \rangle \in r)$

definition

IsDenseUnp ($_$ {is not-properly dense in} $_$ {with respect to} $_$) where
 A {is not-properly dense in} X {with respect to} $r \equiv$
 $\forall x \in X. \forall y \in X. \langle x, y \rangle \in r \wedge x \neq y \longrightarrow (\exists z \in A. \langle x, z \rangle \in r \wedge \langle z, y \rangle \in r)$

definition

IsWeaklyDenseSub ($_$ {is weakly dense in} $_$ {with respect to} $_$) where
 A {is weakly dense in} X {with respect to} $r \equiv$
 $\forall x \in X. \forall y \in X. \langle x, y \rangle \in r \wedge x \neq y \longrightarrow ((\exists z \in A - \{x, y\}. \langle x, z \rangle \in r \wedge \langle z, y \rangle \in r) \vee \text{IntervalX}(X, r, x, y) = 0)$

definition

IsDense ($_$ {is dense with respect to} $_$) where
 X {is dense with respect to} $r \equiv$
 $\forall x \in X. \forall y \in X. \langle x, y \rangle \in r \wedge x \neq y \longrightarrow (\exists z \in X - \{x, y\}. \langle x, z \rangle \in r \wedge \langle z, y \rangle \in r)$

lemma dense_sub:

shows $(X \text{ {is dense with respect to} } r) \longleftrightarrow (X \text{ {is dense in} } X \text{ {with respect to} } r)$

unfolding IsDenseSub_def IsDense_def by auto

```

Actually a connected order topology is one that comes from a dense and complete order.

First a lemma. In a complete ordered set, every non-empty set bounded from below has a maximum lower bound.

```

lemma complete_order_bounded_below:
  assumes  $r \{ \text{is complete} \}$  IsBoundedBelow(A,r)  $A \neq 0 \ r \subseteq X \times X$ 
  shows HasAmaximum( $r, \bigcap c \in A. \ r - \{c\}$ )

```

```

71.4 Numerability axioms

A κ -separable order topology is in relation with order density.

If an order topology has a subset A which is topologically dense, then that subset is weakly order-dense in X .

lemma $\text{dense_top_imp_Wdense_ord}$:

$\text{assumes } \text{IsLinOrder}(X, r) \text{ Closure}(A, \text{OrdTopology } X \ r) = X \ A \subseteq X \ \exists x \ y. \ x \neq y \wedge x \in X \wedge y \in X$

$\text{shows } A \{\text{is weakly dense in}\} X \{\text{with respect to}\} r$

proof-

```

{
  fix r1 r2 assume  $r1 \in X \wedge r2 \in X \wedge r1 \neq r2$   $\langle r1, r2 \rangle \in r$ 
  then have  $\text{IntervalX}(X, r, r1, r2) \subseteq \{\text{IntervalX}(X, r, b, c) \mid \langle b, c \rangle \in X \times X\} \cup \{\text{LeftRayX}(X, r, b) \mid b \in X\} \cup$

```

Conversely, a weakly order-dense set is topologically dense if it is also considered that: if there is a maximum or a minimum elements whose singletons are open, this points have to be in A . In conclusion, weakly order-density is a property closed to topological density.

Another way to see this: Consider a weakly order-dense set A :

- If X has a maximum and a minimum and $\{min, max\}$ is open: A is topologically dense in $X \setminus \{min, max\}$, where min is the minimum in X and max is the maximum in X .
- If X has a maximum, $\{max\}$ is open and X has no minimum or $\{min\}$ isn't open: A is topologically dense in $X \setminus \{max\}$, where max is the maximum in X .
- If X has a minimum, $\{min\}$ is open and X has no maximum or $\{max\}$ isn't open A is topologically dense in $X \setminus \{min\}$, where min is the minimum in X .
- If X has no minimum or maximum, or $\{min, max\}$ has no proper open sets: A is topologically dense in X .

lemma `Wdense_ord_imp_dense_top`:

```

  assumes IsLinOrder(X,r) A{is weakly dense in}X{with respect to}r A⊆X
  ∃x y. x ≠ y ∧ x ∈ X ∧ y ∈ X
  HasAminimum(r,X)⟶{Minimum(r,X)}∈(OrdTopology X r)⟶Minimum(r,X)∈A
  HasAmaximum(r,X)⟶{Maximum(r,X)}∈(OrdTopology X r)⟶Maximum(r,X)∈A
  shows Closure(A,OrdTopology X r)=X

```

72 Properties in topology 2

```

theory Topology_ZF_properties_2 imports Topology_ZF_7 Topology_ZF_1b
  Finite_ZF_1 Topology_ZF_11

```

begin

72.1 Local properties.

This theory file deals with local topological properties; and applies local compactness to the one point compactification.

We will say that a topological space is locally @term"P" iff every point has a neighbourhood basis of subsets that have the property @term"P" as subspaces.

definition

```

  IsLocally (_{is locally}_ 90)
  where T{is a topology} ==> T{is locally}P ≡ (∀x∈⋃T. ∀b∈T. x∈b →
    (∃c∈Pow(b). x∈Interior(c,T) ∧ P(c,T)))

```

72.2 First examples

Our first examples deal with the locally finite property. Finiteness is a property of sets, and hence it is preserved by homeomorphisms; which are

in particular bijective.

The discrete topology is locally finite.

```

lemma discrete_locally_finite:
  shows Pow(A){is locally}(λA.(λB. Finite(A)))
proof-
  have ∀b∈Pow(A). ⋃ (Pow(A){restricted to}b)=b unfolding RestrictedTo_def
by blast
  then have ∀b∈{{x}. x∈A}. Finite(b) by auto moreover
  have reg:∀S∈Pow(A). Interior(S,Pow(A))=S unfolding Interior_def by
auto
  {
    fix x b assume x∈⋃ Pow(A) b∈Pow(A) x∈b
    then have {x}⊆b x∈Interior({x},Pow(A)) Finite({x}) using reg by
auto
    then have ∃c∈Pow(b). x∈Interior(c,Pow(A))∧Finite(c) by blast
  }
  then have ∀x∈⋃ Pow(A). ∀b∈Pow(A). x∈b → (∃c∈Pow(b). x∈Interior(c,Pow(A))
∧ Finite(c)) by auto
  then show thesis using IsLocally_def[OF Pow_is_top] by auto
qed

```

The included set topology is locally finite when the set is finite.

```

lemma included_finite_locally_finite:
  assumes Finite(A) and A⊆X
  shows (IncludedSet(X,A)){is locally}(λA.(λB. Finite(A)))
proof-
  have ∀b∈Pow(X). b∩A⊆b by auto moreover
  note assms(1)
  ultimately have rr:∀b∈{A∪{x}. x∈X}. Finite(b) by force
  {
    fix x b assume x∈⋃ (IncludedSet(X,A)) b∈(IncludedSet(X,A)) x∈b
    then have A∪{x}⊆b A∪{x}∈{A∪{x}. x∈X} and sub: b⊆X unfolding IncludedSet_def

(∃c∈Pow(b). x∈Interior(c,IncludedSet(X,A))∧ Finite(c)) by auto
  then show thesis using IsLocally_def includedset_is_topology by auto
qed

```

72.3 Local compactness

definition

IsLocallyComp (_{is locally-compact} 70)

where $T\{\text{is locally-compact}\} \equiv T\{\text{is locally}\}(\lambda B. \lambda T. B\{\text{is compact in}\}T)$

We center ourselves in local compactness, because it is a very important tool in topological groups and compactifications.

If a subset is compact of some cardinal for a topological space, it is compact of the same cardinal in the subspace topology.

```

lemma compact_imp_compact_subspace:
  assumes A{is compact of cardinal}K{in}T A⊆B
  shows A{is compact of cardinal}K{in}(T{restricted to}B) unfolding IsCompactOfCard_def

qed

```

This last corollary has an explanation: In Hausdorff spaces, compact sets are closed and regular spaces are exactly the "locally closed spaces" (those which have a neighbourhood basis of closed sets). So the neighbourhood basis of compact sets also works as the neighbourhood basis of closed sets we needed to find.

72.5 Hereditary properties and local properties

In this section, we prove a relation between a property and its local property for hereditary properties. Then we apply it to locally-Hausdorff or locally- T_2 . We also prove the relation between locally- T_2 and another property that appeared when considering anti-properties, the anti-hyperconnectness.

If a property is hereditary in open sets, then local properties are equivalent to find just one open neighbourhood with that property instead of a whole local basis.

```

Now we find a counter-example for: Every anti-hyperconnected space is locally-Hausdorff.

The example we are going to consider is the following. Put in X an anti-hyperconnected topology, where an infinite number of points don't have finite sets as neighbourhoods. Then add a new point to the set, $p \notin X$. Consider the open sets on $X \cup p$ as the anti-hyperconnected topology and the open sets that contain p are $p \cup A$ where $X \setminus A$ is finite.

This construction equals the one-point compactification iff X is anti-compact; i.e., the only compact sets are the finite ones. In general this topology is contained in the one-point compactification topology, making it compact too.

It is easy to check that any open set containing p meets infinite other non-empty open set. The question is if such a topology exists.

The previous construction, applied to a densely ordered topology, gives the desired counterexample. What happens is that every neighbourhood of $\bigcup T$ is dense; because there are no finite open sets, and hence meets every non-empty open set. In conclusion, $\bigcup T$ cannot be separated from other points by disjoint open sets.

Every open set that contains $\bigcup T$ is dense, when considering the order topology in a densely ordered set with more than two points.

begin

```

This theory file deals with more topological properties and the relation with the previous ones in other theory files.

73.1 More anti-properties

In this section we study more anti-properties.

73.2 First examples

A first example of an anti-compact space is the discrete space.

```

lemma pow_compact_imp_finite:
  assumes B{is compact in}Pow(A)
  shows Finite(B)

qed

```

In a previous file, `Topology_ZF_5.thy`, we proved that the spectrum of the lindelöf property depends on the axiom of countable choice on subsets of the power set of the natural number.

In this context, the examples depend on whether this choice principle holds or not. This is the reason that the examples of anti-lindelöf topologies are left for the next section.

73.3 Structural results

We first differentiate the spectrum of the lindelöf property depending on some axiom of choice.

```

lemma lindeloef_spec1:
  assumes {the axiom of} nat {choice holds for subsets}(Pow(nat))
  shows (A {is in the spectrum of} ( $\lambda T. ((\bigcup T)\{\text{is lindeloef in}\}T))$ )  $\longleftrightarrow$

```

In conclusion, we reached another equivalence of this choice principle.

The axiom of countable choice holds for subsets of the power set of the natural numbers if and only if there exists a topological space which is anti-lindelof but not anti-compact; this space can be chosen as the one-point compactification of the discrete topology on \mathbb{N} .

```

In the file `Topology_ZF_properties.thy`, it is proven that \mathbb{N} is lindelof if and only if the axiom of countable choice holds for subsets of $\text{Pow}(\mathbb{N})$. Now we check that, in ZF, this space is always anti-lindelof.

```

```

This result is interesting because depending on the different axioms we add to ZF, it means two different things:

- Every subspace of \mathbb{N} is Lindeloeff.
- Only the compact subspaces of \mathbb{N} are Lindeloeff.

Now, we could wonder if the class of compact spaces and the class of lindeloeff spaces being equal is consistent in ZF. Let's find a topological space which is lindeloeff and no compact without assuming any axiom of choice or any negation of one. This will prove that the class of lindeloeff spaces and the class of compact spaces cannot be equal in any model of ZF.

73.4 More Separation properties

In this section we study more separation properties.

73.5 Definitions

We start with a property that has already appeared in `Topology_ZF_1b.thy`. A KC-space is a space where compact sets are closed.

definition

```

IsKC (_ {is KC}) where
  T{is KC}  $\equiv \forall A \in \text{Pow}(\bigcup T). A\{\text{is compact in}\}T \longrightarrow A\{\text{is closed in}\}T$ 

```

Another type of space is an US-space; those where sequences have at most one limit.

definition

```

IsUS (_ {is US}) where
  T{is US}  $\equiv \forall N \ x \ y. (N : \text{nat} \rightarrow \bigcup T) \wedge \text{NetConvTop}(\langle N, \text{Le} \rangle, x, T) \wedge \text{NetConvTop}(\langle N, \text{Le} \rangle, y, T) \longrightarrow y = x$ 

```

73.6 First results

The proof in `Topology_ZF_1b.thy` shows that a Hausdorff space is KC.

corollary(in `topology0`) `T2_imp_KC`:

```

  assumes T{is T2}
  shows T{is KC}

```

proof-

```

{
  fix A assume A{is compact in}T
  then have A{is closed in}T using in_t2_compact_is_cl assms by auto
}
then show thesis unfolding IsKC_def by auto

```

qed

From the spectrum of compactness, it follows that any KC-space is T_1 .

lemma(in `topology0`) `KC_imp_T1`:

```

  assumes T{is KC}
  shows T{is T1}

```

proof-

```

{
  fix x assume A: x ∈ ⋃ T
  have Finite({x}) by auto
  then have {x}{is in the spectrum of}(λT. (⋃ T){is compact in}T)
    using compact_spectrum by auto moreover
  have (T{restricted to}{x}){is a topology} using Top_1_L4 by auto
  moreover have ⋃ (T{restricted to}{x})={x} using A unfolding RestrictedTo_def
by auto
  ultimately have com:{x}{is compact in}(T{restricted to}{x}) unfold-
ing Spec_def
  by auto
  then have {x}{is compact in}T using compact_subspace_imp_compact
A by auto
  then have {x}{is closed in}T using assms unfolding IsKC_def using
A by auto
}
then show thesis using T1_iff_singleton_closed by auto
qed

```

Even more, if a space is KC, then it is US. We already know that for T_2 spaces, any net or filter has at most one limit; and that this property is equivalent with T_2 . The US property is much weaker because we don't know what happens with other nets that are not directed by the order on the natural numbers.

theorem(in topology0) KC_imp_US:

assumes T{is KC}

shows T{is US}

proof-

```

73.7 Counter-examples

We need to find counter-examples that prove that this properties are new ones.

We know that $T_2 \Rightarrow \text{loc}.T_2 \Rightarrow \text{anti-hyperconnected} \Rightarrow T_1$ and $T_2 \Rightarrow KC \Rightarrow US \Rightarrow T_1$. The question is: What is the relation between KC or US and, $\text{loc}.T_2$ or anti-hyperconnected?

In the file `Topology_ZF_properties_2.thy` we built a topological space which is locally- T_2 but no T_2 . It happens actually that this space is not even US given the appropriate topology T .

lemma (in topology0) locT2_not_US_1:

assumes $\{m\} \notin T$ $\{m\}$ is closed in T $\exists N \in \text{nat} \rightarrow \bigcup T. (\langle N, Le \rangle \rightarrow_N m) \wedge m \notin N\text{nat}$

shows $\exists N \in \text{nat} \rightarrow \bigcup (T \cup \{(U - \{m\}) \cup \{\bigcup T\}\} \cup W. \langle U, W \rangle \in \{V \in T. m \in V\} \times T\}) . (\langle N, Le \rangle \rightarrow_N \bigcup T \{in\} (T \cup \{(U - \{m\}) \cup \{\bigcup T\}\} \cup W. \langle U, W \rangle \in \{V \in T. m \in V\} \times T\}))$
 $\wedge (\langle N, Le \rangle \rightarrow_N m \{in\} (T \cup \{(U - \{m\}) \cup \{\bigcup T\}\} \cup W. \langle U, W \rangle \in \{V \in T. m \in V\} \times T\}))$

proof-

from assms(3) obtain N where $N : N : \text{nat} \rightarrow \bigcup T \langle N, Le \rangle \rightarrow_N m \wedge m \notin N\text{nat}$ by auto

```

In particular, we also know that a locally- T_2 space doesn't need to be KC; since $KC \Rightarrow US$. Also we know that anti-hyperconnected spaces don't need to be KC or US, since locally- $T_2 \Rightarrow$ anti-hyperconnected.

Let's find a KC space that is not T_2 , an US space which is not KC and a T_1 space which is not US.

First, let's prove some lemmas about what relation is there between this properties under the influence of other ones. This will help us to find counter-examples.

Anti-compactness erases the differences between several properties.

```

lemma (in topology0) anticomcompact_KC_equiv_T1:
  assumes T {is anti-compact}
  shows T {is KC} ⟷ T {is T1}
proof

```

```

    assume T{is KC}
    then show T{is T1} using KC_imp_T1 by auto

```

Then if we find an anti-compact and T_1 but no T_2 space, there is a counter-example for $KC \Rightarrow T_2$. A counter-example for US doesn't need to be KC mustn't be anti-compact.

The cocountable topology on $\text{csucc}(\text{nat})$ is such a topology.

The cocountable topology on \mathbb{N}^+ is hyperconnected.

In conclusion, the cocountable topology defined on $\text{csucc}(\text{nat})$ is KC but not T_2 . Also note that is KC but not anti-hyperconnected, hence KC or US spaces need not to be sober.

The cofinite topology on the natural numbers is T_1 , but not US.

To end, we need a space which is US but no KC. This example comes from the one point compactification of a T_2 , anti-compact and non discrete space. This T_2 , anti-compact and non discrete space comes from a construction over the cardinal \mathbb{N}^+ or $\text{csucc}(\text{nat})$.

theorem extension_pow_top:

In conclusion, $US \not\equiv KC$.

73.8 Other types of properties

In this section we will define new properties that aren't defined as anti-properties and that are not separation axioms. In some cases we will consider their anti-properties.

73.9 Definitions

A space is called perfect if it has no isolated points. This definition may vary in the literature to similar, but not equivalent definitions.

definition

IsPerf ($_ \{\text{is perfect}\}$) **where**
 $T\{\text{is perfect}\} \equiv \forall x \in \bigcup T. \{x\} \notin T$

An anti-perfect space is called scattered.

definition

IsScatt ($_ \{\text{is scattered}\}$) **where**
 $T\{\text{is scattered}\} \equiv T\{\text{is anti-}\}\text{IsPerf}$

A topological space with two disjoint dense subspaces is called resolvable.

definition

`IsRes (_ {is resolvable}) where`
`T{is resolvable} $\equiv \exists U \in \text{Pow}(\bigcup T). \exists V \in \text{Pow}(\bigcup T). \text{Closure}(U, T) = \bigcup T \wedge \text{Closure}(V, T) = \bigcup T$`
 `$\wedge U \cap V = 0$`

A topological space where every dense subset is open is called submaximal.

definition

`IsSubMax (_ {is submaximal}) where`
`T{is submaximal} $\equiv \forall U \in \text{Pow}(\bigcup T). \text{Closure}(U, T) = \bigcup T \longrightarrow U \in T$`

A subset of a topological space is nowhere-dense if the interior of its closure is empty.

definition

`IsNowhereDense (_ {is nowhere dense in} _) where`
`A{is nowhere dense in} T $\equiv A \subseteq \bigcup T \wedge \text{Interior}(\text{Closure}(A, T), T) = 0$`

A topological space is then a Luzin space if every nowhere-dense subset is countable.

definition

`IsLuzin (_ {is luzin}) where`
`T{is luzin} $\equiv \forall A \in \text{Pow}(\bigcup T). (A \text{ is nowhere dense in } T) \longrightarrow A \lesssim_{\text{nat}}$`

An also useful property is local-connexion.

definition

`IsLocConn (_ {is locally-connected}) where`
`T{is locally-connected} $\equiv T \text{ is locally } (\lambda T. \lambda B. ((T \text{ restricted to } B) \text{ is connected}))$`

An SI-space is an anti-resolvable perfect space.

definition

`IsAntiRes (_ {is anti-resolvable}) where`
`T{is anti-resolvable} $\equiv T \text{ is anti-} \text{IsRes}$`

definition

`IsSI (_ {is Strongly Irresolvable}) where`
`T{is Strongly Irresolvable} $\equiv (T \text{ is anti-resolvable}) \wedge (T \text{ is perfect})$`

73.10 First examples

The existence of T_2 , uncountable, perfect and luzin spaces is unprovable in *ZFC*. It is related to the *CH* and Martin's axiom.

end

74 Uniform spaces

```

theory UniformSpace_ZF imports Topology_ZF_4a
begin

```

This theory defines uniform spaces and proves their basic properties.

74.1 Definition and motivation

Just like a topological space constitutes the minimal setting in which one can speak of continuous functions, the notion of uniform spaces (commonly attributed to André Weil) captures the minimal setting in which one can

speak of uniformly continuous functions. In some sense this is a generalization of the notion of metric (or metrizable) spaces and topological groups.

There are several definitions of uniform spaces. The fact that these definitions are equivalent is far from obvious (some people call such phenomenon cryptomorphism). We will use the definition of the uniform structure (or "uniformity") based on entourages. This was the original definition by Weil and it seems to be the most commonly used. A uniformity consists of entourages that are binary relations between points of space X that satisfy a certain collection of conditions, specified below.

definition

```
IsUniformity ( _ {is a uniformity on} _ 90) where
   $\Phi$  {is a uniformity on}  $X \equiv (\Phi$  {is a filter on}  $(X \times X))$ 
   $\wedge (\forall U \in \Phi. \text{id}(X) \subseteq U \wedge (\exists V \in \Phi. V \circ V \subseteq U) \wedge \text{converse}(U) \in \Phi)$ 
```

A Member of a uniformity on X is a reflexive relation on X .

```
lemma unif_props: assumes  $\Phi$  {is a uniformity on}  $X$   $A \in \Phi$ 
  shows  $A \subseteq X \times X$  and  $\text{id}(X) \subseteq A$ 
  using assms IsUniformity_def IsFilter_def by auto
```

The definition of uniformity states (among other things) that for every member U of uniformity Φ there is another one, say V such that $V \circ V \subseteq U$. Sometimes such V is said to be half the size of U . The next lemma states that V can be taken to be symmetric.

```
lemma half_size_sym: assumes  $\Phi$  {is a uniformity on}  $X$   $U \in \Phi$ 
  shows  $\exists W \in \Phi. W \circ W \subseteq U \wedge W = \text{converse}(W)$ 
```

proof -

```
  from assms obtain V where  $V \in \Phi$  and  $V \circ V \subseteq U$ 
    unfolding IsUniformity_def by auto
  let  $W = V \cap \text{converse}(V)$ 
  from assms(1)  $\langle V \in \Phi \rangle$  have  $W \in \Phi$  and  $W = \text{converse}(W)$ 
    unfolding IsUniformity_def IsFilter_def by auto
  moreover from  $\langle V \circ V \subseteq U \rangle$  have  $W \circ W \subseteq U$  by auto
  ultimately show thesis by blast
```

qed

If Φ is a uniformity on X , then the every element V of Φ is a certain relation on X (a subset of $X \times X$) and is called an "entourage". For an $x \in X$ we call $V\{x\}$ a neighborhood of x . The first useful fact we will show is that neighborhoods are non-empty.

lemma neigh_not_empty:

```
  assumes  $\Phi$  {is a uniformity on}  $X$   $V \in \Phi$  and  $x \in X$ 
  shows  $V\{x\} \neq \emptyset$  and  $x \in V\{x\}$ 
```

proof -

```
  from assms(1,2) have  $\text{id}(X) \subseteq V$  using IsUniformity_def IsFilter_def
    by auto
```

```

    with (x∈X) show x∈V{x} and V{x} ≠ 0 by auto
qed

```

If Φ is a uniformity on X then every element of Φ is a subset of $X \times X$ whose domain is x .

```

lemma uni_domain:
  assumes  $\Phi$  {is a uniformity on} X  $W \in \Phi$ 
  shows  $W \subseteq X \times X$  and  $\text{domain}(W) = X$ 
proof -
  from assms show  $W \subseteq X \times X$  unfolding IsUniformity_def IsFilter_def
    by blast
  show  $\text{domain}(W) = X$ 
  proof
    from assms show  $\text{domain}(W) \subseteq X$  unfolding IsUniformity_def IsFilter_def

    by auto
    from assms show  $X \subseteq \text{domain}(W)$  unfolding IsUniformity_def by blast
  qed
qed

```

Uniformity Φ defines a natural topology on its space X via the neighborhood system that assigns the collection $\{V(\{x\}) : V \in \Phi\}$ to every point $x \in X$. In the next lemma we show that if we define a function this way the values of that function are what they should be. This is only a technical fact which is useful to shorten the remaining proofs, usually treated as obvious in standard mathematics.

```

lemma neigh_filt_fun:
  assumes  $\Phi$  {is a uniformity on} X
  defines  $\mathcal{M} \equiv \{\langle x, \{V\{x\}.V \in \Phi\} \rangle. x \in X\}$ 
  shows  $\mathcal{M} : X \rightarrow \text{Pow}(\text{Pow}(X))$  and  $\forall x \in X. \mathcal{M}(x) = \{V\{x\}.V \in \Phi\}$ 
proof -
  from assms have  $\forall x \in X. \{V\{x\}.V \in \Phi\} \in \text{Pow}(\text{Pow}(X))$ 
    using IsUniformity_def IsFilter_def image_subset by auto
  with assms show  $\mathcal{M} : X \rightarrow \text{Pow}(\text{Pow}(X))$  using ZF_fun_from_total by simp
  with assms show  $\forall x \in X. \mathcal{M}(x) = \{V\{x\}.V \in \Phi\}$  using ZF_fun_from_tot_val
    by simp
qed

```

In the next lemma we show that the collection defined in lemma `neigh_filt_fun` is a filter on X . The proof is kind of long, but it just checks that all filter conditions hold.

```

lemma filter_from_uniformity:
  assumes  $\Phi$  {is a uniformity on} X and  $x \in X$ 
  defines  $\mathcal{M} \equiv \{\langle x, \{V\{x\}.V \in \Phi\} \rangle. x \in X\}$ 
  shows  $\mathcal{M}(x)$  {is a filter on} X
proof -
  from assms have PhiFilter:  $\Phi$  {is a filter on} (X×X) and
     $\mathcal{M} : X \rightarrow \text{Pow}(\text{Pow}(X))$  and  $\mathcal{M}(x) = \{V\{x\}.V \in \Phi\}$ 

```

```

    using IsUniformity_def neigh_filt_fun by auto
  have  $0 \notin \mathcal{M}(x)$ 
  proof -
    from assms  $\langle x \in X \rangle$  have  $0 \notin \{V\{x\}.V \in \Phi\}$  using neigh_not_empty by blast

The function defined in the premises of lemma `neigh_filt_fun` (or `filter_from_uniformity`) is a neighborhood system. The proof uses the existence of the "half-the-size" neighborhood condition ($\exists V \in \Phi. V \cap V \subseteq U$) of the uniformity definition, but not the $\text{converse}(U) \in \Phi$ part.

```

theorem neigh_from_uniformity:

When we have a uniformity Φ on X we can define a topology on X in a (relatively) natural way. We will call that topology the `UniformTopology(Φ)`. The definition may be a bit cryptic but it just combines the construction of a neighborhood system from uniformity as in the assumptions of lemma `filter_from_uniformity` and the construction of topology from a neighborhood system from theorem `topology_from_neighs`. We could probably reformulate the definition to skip the X parameter because if Φ is a uniformity on X then X can be recovered from (is determined by) Φ .

definition

`UniformTopology(Φ ,X) ≡ {U ∈ Pow(X). ∀x∈U. U ∈ {⟨t,{V{t}.V∈Φ⟩.t∈X}(x)}}`

The collection of sets constructed in the `UniformTopology` definition is indeed a topology on X .

theorem `uniform_top_is_top`:

`assumes Φ {is a uniformity on} X`

`shows`

`UniformTopology(Φ ,X) {is a topology} and \bigcup UniformTopology(Φ ,X) = X`

`using assms neigh_from_uniformity UniformTopology_def topology_from_neighs by auto`

end

75 More on uniform spaces

theory `UniformSpace_ZF_1` **imports** `func_ZF_1` `UniformSpace_ZF` `Topology_ZF_2`
begin

This theory defines the maps to study in uniform spaces and proves their basic properties.

75.1 Uniformly continuous functions

Just as the the most general setting for continuity of functions is that of topological spaces, uniform spaces are the most general setting for the study of uniform continuity.

A map between 2 uniformities is uniformly continuous if it preserves the entourages:

definition

`IsUniformlyCont` (`_` {is uniformly continuous between} `_` {and} `_` 90) where
`f:X→Y ==> Φ` {is a uniformity on} `X ==> Γ` {is a uniformity on} `Y ==>`

`f` {is uniformly continuous between} `Φ` {and} `Γ` $\equiv \forall V \in \Gamma. (\text{ProdFunction}(f, f) - V) \in \Phi$

Any uniformly continuous function is continuous when considering the topologies on the uniformities.

lemma `uniformly_cont_is_cont`:

`assumes` `f:X→Y` `Φ` {is a uniformity on} `X` `Γ` {is a uniformity on} `Y`
`f` {is uniformly continuous between} `Φ` {and} `Γ`
`shows` `IsContinuous(UniformTopology(Φ,X),UniformTopology(Γ,Y),f)`

proof -

{ `fix` `U` `assume` `op`: `U` \in `UniformTopology(Γ,Y)`

76 Alternative definitions of uniformity

theory UniformSpace_ZF_2 **imports** UniformSpace_ZF
begin

The `UniformSpace_ZF` theory defines uniform spaces based on entourages (also called surroundings sometimes). In this theory we consider an alternative definition based of the notion of uniform covers.

76.1 Uniform covers

Given a set X we can consider collections of subsets of X whose unions are equal to X . Any such collection is called a cover of X . We can define relation on the set of covers of X , called "star refinement" (definition below). A collection of covers is a "family of uniform covers" if it is a filter with respect to the start refinement ordering. The members of such family are called a "uniform cover", but one has to remember that this notion has meaning only in the contexts a the whole family of uniform covers. Looking at a specific cover in isolation we can not say whether it is a uniform cover or not.

The set of all covers of X is called $\text{Covers}(X)$.

definition

$$\text{Covers}(X) \equiv \{P \in \text{Pow}(\text{Pow}(X)) \mid \bigcup P = X\}$$

A cover of a nonempty set must have a nonempty member.

lemma cover_nonempty: **assumes** $X \neq 0$ $P \in \text{Covers}(X)$
shows $\exists U \in P. U \neq 0$
using **assms** **unfolding** Covers_def **by** blast

A "star" of R with respect to \mathcal{R} is the union of all $S \in \mathcal{R}$ that intersect R .

definition

$\text{Star}(U, P) \equiv \bigcup \{V \in P. V \cap U \neq 0\}$

An element of \mathcal{R} is a subset of its star with respect to \mathcal{R} .

lemma element_subset_star: **assumes** $U \in P$ **shows** $U \subseteq \text{Star}(U, P)$
using **assms** **unfolding** Star_def **by** auto

An alternative formula for star of a singleton.

lemma star_singleton: **shows** $(\bigcup \{V \times V. V \in P\})\{x\} = \text{Star}(\{x\}, P)$
unfolding Star_def **by** blast

Star of a larger set is larger.

lemma star_mono: **assumes** $U \subseteq V$ **shows** $\text{Star}(U, P) \subseteq \text{Star}(V, P)$
using **assms** **unfolding** Star_def **by** blast

In particular, star of a set is larger than star of any singleton in that set.

corollary star_single_mono: **assumes** $x \in U$ **shows** $\text{Star}(\{x\}, P) \subseteq \text{Star}(U, P)$
using **assms** star_mono **by** auto

A cover \mathcal{R} (of X) is said to be a "barycentric refinement" of a cover \mathcal{C} iff for every $x \in X$ the star of $\{x\}$ in \mathcal{R} is contained in some $C \in \mathcal{C}$.

definition

$\text{IsBarycentricRefinement } (_ <^B _ \ 90)$
where $P <^B Q \equiv \forall x \in \bigcup P. \exists U \in Q. \text{Star}(\{x\}, P) \subseteq U$

A cover is a barycentric refinement of the collection of stars of the singletons $\{x\}$ as x ranges over X .

lemma singl_star_bary:
assumes $P \in \text{Covers}(X)$ **shows** $P <^B \{\text{Star}(\{x\}, P). x \in X\}$
using **assms** **unfolding** Covers_def IsBarycentricRefinement_def **by** blast

A cover \mathcal{R} is a "star refinement" of a cover \mathcal{C} iff for each $R \in \mathcal{R}$ there is a $C \in \mathcal{C}$ such that the star of R with respect to \mathcal{R} is contained in C .

definition

$\text{IsStarRefinement } (_ <^* _ \ 90)$
where $P <^* Q \equiv \forall U \in P. \exists V \in Q. \text{Star}(U, P) \subseteq V$

Every cover star-refines the trivial cover $\{X\}$.

lemma cover_stref_triv: **assumes** $P \in \text{Covers}(X)$ **shows** $P <^* \{X\}$
using **assms** **unfolding** Star_def IsStarRefinement_def Covers_def **by** auto

Star refinement implies barycentric refinement.

```

```

The notion of a filter defined in Topology_ZF_4 is not sufficiently general

to use it to define uniform covers, so we write the conditions directly. A nonempty collection Θ of covers of X is a family of uniform covers if

- a) if $\mathcal{R} \in \Theta$ and \mathcal{C} is any cover of X such that \mathcal{R} is a star refinement of \mathcal{C} , then $\mathcal{C} \in \Theta$.
- b) For any $\mathcal{C}, \mathcal{D} \in \Theta$ there is some $\mathcal{R} \in \Theta$ such that \mathcal{R} is a star refinement of both \mathcal{C} and \mathcal{D} .

This departs slightly from the definition in Wikipedia that requires that Θ contains the trivial cover $\{X\}$. As we show in lemma `unicov_contains_trivial` below we don't lose anything by weakening the definition this way.

definition

```
AreUniformCovers ( _ {are uniform covers of} _ 90)
where  $\Theta$  {are uniform covers of}  $X \equiv \Theta \subseteq \text{Covers}(X) \wedge \Theta \neq \emptyset \wedge$ 
 $(\forall \mathcal{R} \in \Theta. \forall \mathcal{C} \in \text{Covers}(X). ((\mathcal{R} <^* \mathcal{C}) \longrightarrow \mathcal{C} \in \Theta)) \wedge$ 
 $(\forall \mathcal{C} \in \Theta. \forall \mathcal{D} \in \Theta. \exists \mathcal{R} \in \Theta. (\mathcal{R} <^* \mathcal{C}) \wedge (\mathcal{R} <^* \mathcal{D}))$ 
```

A family of uniform covers contain the trivial cover $\{X\}$.

lemma `unicov_contains_triv`: `assumes` Θ {are uniform covers of} X `shows` $\{X\} \in \Theta$

proof -

```
from assms obtain  $\mathcal{R}$  where  $\mathcal{R} \in \Theta$  unfolding AreUniformCovers_def by blast
with assms show thesis using cover_stref_triv
unfolding AreUniformCovers_def Covers_def by auto
qed
```

If Θ are uniform covers of X then we can recover X from Θ by taking $\bigcup \Theta$.

lemma `space_from_unicov`: `assumes` Θ {are uniform covers of} X `shows` $X = \bigcup \Theta$

proof

```
from assms show  $X \subseteq \bigcup \Theta$  using unicov_contains_triv
unfolding AreUniformCovers_def by auto
from assms show  $\bigcup \Theta \subseteq X$  unfolding AreUniformCovers_def Covers_def
by auto
qed
```

Every uniform cover has a star refinement.

lemma `unicov_has_star_ref`:

```
assumes  $\Theta$  {are uniform covers of}  $X$  and  $P \in \Theta$ 
shows  $\exists Q \in \Theta. (Q <^* P)$ 
using assms unfolding AreUniformCovers_def by blast
```

In particular, every uniform cover has a barycentric refinement.

corollary `unicov_has_bar_ref`:

```
assumes  $\Theta$  {are uniform covers of}  $X$  and  $P \in \Theta$ 
shows  $\exists Q \in \Theta. (Q <^B P)$ 
```

proof -

```

from assms obtain Q where  $Q \in \Theta$  and  $Q <^* P$ 
  using unicov_has_star_ref by blast
with assms show thesis
  unfolding AreUniformCovers_def using star_is_bary by blast
qed

```

From the definition of uniform covers we know that if a uniform cover P is a star-refinement of a cover Q then Q is in a uniform cover. The next lemma shows that in order for Q to be a uniform cover it is sufficient that P is a barycentric refinement of Q .

```

lemma unicov_bary_cov:
  assumes  $\Theta$  {are uniform covers of}  $X$   $P \in \Theta$   $Q \in \text{Covers}(X)$   $P <^B Q$  and
 $X \neq 0$ 
  shows  $Q \in \Theta$ 
proof -
  from assms(1,2) obtain R where  $R \in \Theta$  and  $R <^B P$ 
    using unicov_has_bar_ref by blast
  from assms(1,2,3)  $(R \in \Theta)$  have
     $P \in \text{Covers}(X)$   $Q \in \text{Covers}(X)$   $R \in \text{Covers}(X)$ 
    unfolding AreUniformCovers_def by auto

Given a uniformity Φ on X we can create a family of uniform covers by taking the collection of covers P for which there exist an entourage $U \in \Phi$ such that for each $x \in X$, there is an $A \in P$ such that $U(\{x\}) \subseteq A$. The next definition specifies the operation of creating a family of uniform covers from a uniformity.

definition

$\text{UniCovFromUniformity}(X, \Phi) \equiv \{P \in \text{Covers}(X). \exists U \in \Phi. \forall x \in X. \exists A \in P. U(\{x\}) \subseteq A\}$

When we convert the quantifiers into unions and intersections in the definition of $\text{UniCovFromUniformity}$ we get an alternative definition of the operation that creates a family of uniform covers from a uniformity. Just a curiosity, not used anywhere.

lemma $\text{UniCovFromUniformityDef}$: assumes $X \neq 0$

shows $\text{UniCovFromUniformity}(X, \Phi) = (\bigcup U \in \Phi. \bigcap x \in X. \{P \in \text{Covers}(X). \exists A \in P. U(\{x\}) \subseteq A\})$

proof -

have $\{P \in \text{Covers}(X). \exists U \in \Phi. \forall x \in X. \exists A \in P. U(\{x\}) \subseteq A\} =$
 $(\bigcup U \in \Phi. \bigcap x \in X. \{P \in \text{Covers}(X). \exists A \in P. U(\{x\}) \subseteq A\})$

proof

```

77 Topological groups - introduction

```
theory TopologicalGroup_ZF imports Topology_ZF_3 Group_ZF_1 Semigroup_ZF
```

```
begin
```

This theory is about the first subject of algebraic topology: topological groups.

77.1 Topological group: definition and notation

Topological group is a group that is a topological space at the same time. This means that a topological group is a triple of sets, say (G, f, T) such that T is a topology on G , f is a group operation on G and both f and the operation of taking inverse in G are continuous. Since IsarMathLib defines topology without using the carrier, (see `Topology_ZF`), in our setup we just use $\bigcup T$ instead of G and say that the pair of sets $(\bigcup T, f)$ is a group. This way our definition of being a topological group is a statement about two sets: the topology T and the group operation f on $G = \bigcup T$. Since the domain of the group operation is $G \times G$, the pair of topologies in which f is supposed to be continuous is T and the product topology on $G \times G$ (which we will call τ below).

This way we arrive at the following definition of a predicate that states that pair of sets is a topological group.

definition

```
IsAtopologicalGroup(T,f)  $\equiv$  (T {is a topology})  $\wedge$  IsAgroup( $\bigcup T$ ,f)  $\wedge$   
IsContinuous(ProductTopology(T,T),T,f)  $\wedge$   
IsContinuous(T,T,GroupInv( $\bigcup T$ ,f))
```

We will inherit notation from the `topology0` locale. That locale assumes that T is a topology. For convenience we will denote $G = \bigcup T$ and τ to be the product topology on $G \times G$. To that we add some notation specific to groups. We will use additive notation for the group operation, even though we don't assume that the group is abelian. The notation $g + A$ will mean the left translation of the set A by element g , i.e. $g + A = \{g + a \mid a \in A\}$. The group operation G induces a natural operation on the subsets of G defined as $\langle A, B \rangle \mapsto \{x + y \mid x \in A, y \in B\}$. Such operation has been considered in `func_ZF` and called f "lifted to subsets of" G . We will denote the value of such operation on sets A, B as $A + B$. The set of neighborhoods of zero (denoted \mathcal{N}_0) is the collection of (not necessarily open) sets whose interior contains the neutral element of the group.

```
locale topgroup = topology0 +
```

```
fixes G
```

```
defines G_def [simp]: G  $\equiv$   $\bigcup T$ 
```

```

fixes prodtop ( $\tau$ )
defines prodtop_def [simp]:  $\tau \equiv \text{ProductTopology}(T,T)$ 

fixes f

assumes Ggroup: IsAgroup(G,f)

assumes fcon: IsContinuous( $\tau,T,f$ )

assumes inv_cont: IsContinuous( $T,T,\text{GroupInv}(G,f)$ )

fixes grop (infixl + 90)
defines grop_def [simp]:  $x+y \equiv f\langle x,y \rangle$ 

fixes grinv (- _ 89)
defines grinv_def [simp]:  $(-x) \equiv \text{GroupInv}(G,f)(x)$ 

fixes grsub (infixl - 90)
defines grsub_def [simp]:  $x-y \equiv x+(-y)$ 

fixes setinv (- _ 72)
defines setninv_def [simp]:  $-A \equiv \text{GroupInv}(G,f)(A)$ 

fixes ltrans (infix + 73)
defines ltrans_def [simp]:  $x + A \equiv \text{LeftTranslation}(G,f,x)(A)$ 

fixes rtrans (infix + 73)
defines rtrans_def [simp]:  $A + x \equiv \text{RightTranslation}(G,f,x)(A)$ 

fixes setadd (infixl + 71)
defines setadd_def [simp]:  $A+B \equiv (f \text{ \{lifted to subsets of\} } G)\langle A,B \rangle$ 

fixes gzero (0)
defines gzero_def [simp]:  $0 \equiv \text{TheNeutralElement}(G,f)$ 

fixes zerohoods ( $\mathcal{N}_0$ )
defines zerohoods_def [simp]:  $\mathcal{N}_0 \equiv \{A \in \text{Pow}(G). 0 \in \text{int}(A)\}$ 

fixes listsum ( $\sum$  _ 70)
defines listsum_def[simp]:  $\sum k \equiv \text{Fold1}(f,k)$ 

```

The first lemma states that we indeed talk about topological group in the context of `topgroup` locale.

```

lemma (in topgroup) topGroup: shows IsAtopologicalGroup(T,f)
  using topSpaceAssum Ggroup fcon inv_cont IsAtopologicalGroup_def
  by simp

```

If a pair of sets (T, f) forms a topological group, then all theorems proven

in the `topgroup` context are valid as applied to (T, f) .

```
lemma topGroupLocale: assumes IsAtopologicalGroup(T,f)
  shows topgroup(T,f)
  using assms IsAtopologicalGroup_def topgroup_def
    topgroup_axioms.intro topology0_def by simp
```

We can use the `group0` locale in the context of `topgroup`.

```
lemma (in topgroup) group0_valid_in_tgroup: shows group0(G,f)
  using Ggroup group0_def by simp
```

We can use the `group0` locale in the context of `topgroup`.

```
sublocale topgroup < group0 G f gzero grop grinv
  unfolding group0_def gzero_def grop_def grinv_def using Ggroup by
  auto
```

We can use `semigr0` locale in the context of `topgroup`.

```
lemma (in topgroup) semigr0_valid_in_tgroup: shows semigr0(G,f)
  using Ggroup IsAgroup_def IsAmonoid_def semigr0_def by simp
```

We can use the `prod_top_spaces0` locale in the context of `topgroup`.

```
lemma (in topgroup) prod_top_spaces0_valid: shows prod_top_spaces0(T,T,T)
  using topSpaceAssum prod_top_spaces0_def by simp
```

Negative of a group element is in group.

```
lemma (in topgroup) neg_in_tgroup: assumes g∈G shows (-g) ∈ G
  using assms inverse_in_group by simp
```

Sum of two group elements is in the group.

```
lemma (in topgroup) group_op_closed_add: assumes x1 ∈ G x2 ∈ G
  shows x1+x2 ∈ G
  using assms group_op_closed by simp
```

Zero is in the group.

```
lemma (in topgroup) zero_in_tgroup: shows 0∈G
  using group0_2_L2 by simp
```

Another lemma about canceling with two group elements written in additive notation

```
lemma (in topgroup) inv_cancel_two_add:
  assumes x1 ∈ G x2 ∈ G
  shows
    x1+(-x2)+x2 = x1
    x1+x2+(-x2) = x1
    (-x1)+(x1+x2) = x2
    x1+((-x1)+x2) = x2
  using assms inv_cancel_two by auto
```

Useful identities proven in the Group_ZF theory, rewritten here in additive notation. Note since the group operation notation is left associative we don't really need the first set of parentheses in some cases.

lemma (in topgroup) cancel_middle_add: assumes $x_1 \in G$ $x_2 \in G$ $x_3 \in G$

shows

$$\begin{aligned}(x_1 + (-x_2)) + (x_2 + (-x_3)) &= x_1 + (-x_3) \\ ((-x_1) + x_2) + ((-x_2) + x_3) &= (-x_1) + x_3 \\ (- (x_1 + x_2)) + (x_1 + x_3) &= (-x_2) + x_3 \\ (x_1 + x_2) + (- (x_3 + x_2)) &= x_1 + (-x_3) \\ (-x_1) + (x_1 + x_2 + x_3) + (-x_3) &= x_2\end{aligned}$$

proof -

from assms have $x_1 + (-x_3) = (x_1 + (-x_2)) + (x_2 + (-x_3))$
 using group0_2_L14A(1) by blast
 thus $(x_1 + (-x_2)) + (x_2 + (-x_3)) = x_1 + (-x_3)$ by simp
 from assms have $(-x_1) + x_3 = ((-x_1) + x_2) + ((-x_2) + x_3)$
 using group0_2_L14A(2) by blast
 thus $((-x_1) + x_2) + ((-x_2) + x_3) = (-x_1) + x_3$ by simp
 from assms show $(- (x_1 + x_2)) + (x_1 + x_3) = (-x_2) + x_3$
 using cancel_middle(1) by simp
 from assms show $(x_1 + x_2) + (- (x_3 + x_2)) = x_1 + (-x_3)$
 using cancel_middle(2) by simp
 from assms show $(-x_1) + (x_1 + x_2 + x_3) + (-x_3) = x_2$
 using cancel_middle(3) by simp

qed

We can cancel an element on the right from both sides of an equation.

lemma (in topgroup) cancel_right_add:
 assumes $x_1 \in G$ $x_2 \in G$ $x_3 \in G$ $x_1 + x_2 = x_3 + x_2$
 shows $x_1 = x_3$
 using assms cancel_right by simp

We can cancel an element on the left from both sides of an equation.

lemma (in topgroup) cancel_left_add:
 assumes $x_1 \in G$ $x_2 \in G$ $x_3 \in G$ $x_1 + x_2 = x_1 + x_3$
 shows $x_2 = x_3$
 using assms cancel_left by simp

We can put an element on the other side of an equation.

lemma (in topgroup) put_on_the_other_side:
 assumes $x_1 \in G$ $x_2 \in G$ $x_3 = x_1 + x_2$
 shows $x_3 + (-x_2) = x_1$ and $(-x_1) + x_3 = x_2$
 using assms group0_2_L18 by auto

A simple equation from lemma simple_equation0 in Group_ZF in additive notation

lemma (in topgroup) simple_equation0_add:
 assumes $x_1 \in G$ $x_2 \in G$ $x_3 \in G$ $x_1 + (-x_2) = (-x_3)$

```

shows  $x_3 = x_2 + (-x_1)$ 
using assms simple_equation0 by blast

```

A simple equation from lemma simple_equation1 in Group_ZF in additive notation

```

lemma (in topgroup) simple_equation1_add:
  assumes  $x_1 \in G \quad x_2 \in G \quad x_3 \in G \quad (-x_1)+x_2 = (-x_3)$ 
  shows  $x_3 = (-x_2) + x_1$ 
  using assms simple_equation1 by blast

```

The set comprehension form of negative of a set. The proof uses the ginv_image lemma from Group_ZF theory which states the same thing in multiplicative notation.

```

lemma (in topgroup) ginv_image_add: assumes  $V \subseteq G$ 
  shows  $(-V) \subseteq G$  and  $(-V) = \{-x. x \in V\}$ 
  using assms ginv_image by auto

```

The additive notation version of ginv_image_el lemma from Group_ZF theory

```

lemma (in topgroup) ginv_image_el_add: assumes  $V \subseteq G \quad x \in (-V)$ 
  shows  $(-x) \in V$ 
  using assms ginv_image_el by simp

```

Of course the product topology is a topology (on $G \times G$).

```

lemma (in topgroup) prod_top_on_G:
  shows  $\tau$  {is a topology} and  $\bigcup \tau = G \times G$ 
  using topSpaceAssum Top_1_4_T1 by auto

```

Let's recall that f is a binary operation on G in this context.

```

77.2 Interval arithmetic, translations and inverse of set

In this section we list some properties of operations of translating a set and reflecting it around the neutral element of the group. Many of the results are proven in other theories, here we just collect them and rewrite in notation specific to the `topgroup` context.

Different ways of looking at adding sets.

```

lemma (in topgroup) interval_add: assumes  $A \subseteq G$   $B \subseteq G$  shows
   $A+B \subseteq G$ 
   $A+B = f(A \times B)$ 
   $A+B = (\bigcup_{x \in A} x+B)$ 
   $A+B = \{x+y. \langle x,y \rangle \in A \times B\}$ 
proof -
  from assms show  $A+B \subseteq G$  and  $A+B = f(A \times B)$  and  $A+B = \{x+y. \langle x,y \rangle \in A \times B\}$ 
  using topgroup_f_binop lift_subsets_explained by auto
  from assms show  $A+B = (\bigcup_{x \in A} x+B)$  using image_ltrans_union by simp
qed

```

If the neutral element is in a set, then it is in the sum of the sets.

```

lemma (in topgroup) interval_add_zero: assumes  $A \subseteq G$   $0 \in A$ 
  shows  $0 \in A+A$ 
proof -
  from assms have  $0+0 \in A+A$  using interval_add(4) by auto
  then show  $0 \in A+A$  using group0_2_L2 by auto
qed

```

Some lemmas from Group_ZF_1 about images of set by translations written in additive notation

```

lemma (in topgroup) lrtrans_image: assumes  $V \subseteq G$   $x \in G$ 
  shows
     $x+V = \{x+v. v \in V\}$ 
     $V+x = \{v+x. v \in V\}$ 
  using assms ltrans_image rtrans_image by auto

```

Right and left translations of a set are subsets of the group. This is of course typically applied to the subsets of the group, but formally we don't need to assume that.

```

lemma (in topgroup) lrtrans_in_group_add: assumes  $x \in G$ 
  shows  $x+V \subseteq G$  and  $V+x \subseteq G$ 
  using assms lrtrans_in_group by auto

```

A corollary from interval_add

77.5 Sums of sequences of elements and subsets

In this section we consider properties of the function $G^n \rightarrow G$, $x = (x_0, x_1, \dots, x_{n-1}) \mapsto \sum_{i=0}^{n-1} x_i$. We will model the cartesian product G^n by the space of sequences $n \rightarrow G$, where $n = \{0, 1, \dots, n-1\}$ is a natural number. This space is equipped with a natural product topology defined in `Topology_ZF_3`.

Let's recall first that the sum of elements of a group is an element of the group.

```

lemma (in topgroup) sum_list_in_group:
  assumes n ∈ nat and x: succ(n)→G
  shows (∑ x) ∈ G
proof -
  from assms have semigr0(G,f) and n ∈ nat x: succ(n)→G
  using semigr0_valid_in_tgroup by auto
  then have Fold1(f,x) ∈ G by (rule semigr0.prod_type)
  thus (∑ x) ∈ G by simp
qed

```

In this context $x+y$ is the same as the value of the group operation on the elements x and y . Normally we shouldn't need to state this as a separate lemma.

```

lemma (in topgroup) grop_def1: shows f⟨x,y⟩ = x+y by simp

```

Another theorem from `Semigroup_ZF` theory that is useful to have in the additive notation.

```

lemma (in topgroup) shorter_set_add:
  assumes n ∈ nat and x: succ(succ(n))→G
  shows (∑ x) = (∑ Init(x)) + (x(succ(n)))
proof -
  from assms have semigr0(G,f) and n ∈ nat x: succ(succ(n))→G
  using semigr0_valid_in_tgroup by auto
  then have Fold1(f,x) = f⟨Fold1(f,Init(x)),x(succ(n))⟩

78 Topological groups 1

theory TopologicalGroup_ZF_1 **imports** TopologicalGroup_ZF Topology_ZF_properties_2
begin

This theory deals with some topological properties of topological groups.

78.1 Separation properties of topological groups

The topological groups have very specific properties. For instance, G is T_0 iff it is T_3 .

```

theorem(in topgroup) cl_point:
  assumes x ∈ G
  shows cl({x}) = (⋂ H ∈ ℱ₀. x + H)
proof-
  {
    have c: cl({x}) = (⋂ H ∈ ℱ₀. {x} + H) using cl_topgroup assms by auto
    {
      fix H
      assume H ∈ ℱ₀
      then have {x} + H = x + H using interval_add(3) assms
        by auto
      with ⟨H ∈ ℱ₀⟩ have {x} + H ∈ {x + H. H ∈ ℱ₀} by auto
    }
    then have {{x} + H. H ∈ ℱ₀} ⊆ {x + H. H ∈ ℱ₀} by auto
    moreover
    {
      fix H
      assume H ∈ ℱ₀

```

```

    then have {x}+H=x+ H using interval_add(3) assms

Every topological group is regular, and hence T_3 . The proof is in the next section, since it uses local properties.

78.4 Local properties

In a topological group, all local properties depend only on the neighbourhoods of the neutral element; when considering topological properties. The next result of regularity, will use this idea, since translations preserve closed sets.

```

lemma (in topgroup) local_iff_neutral:
  assumes ∀U∈T∩ℳ0. ∃N∈ℳ0. N⊆U∧ P(N,T) ∀N∈Pow(G). ∀x∈G. P(N,T) →

79 Topological groups - uniformity

```

theory TopologicalGroup_Uniformity_ZF imports TopologicalGroup_ZF UniformSpace_ZF_1

```

```

begin

```

Each topological group is a uniform space. This theory is about the uniformities that are naturally defined by a topological group structure.

79.1 Natural uniformities in topological groups: definitions and notation

There are two basic uniformities that can be defined on a topological group.

Definition of left uniformity

```

definition (in topgroup) leftUniformity
  where leftUniformity  $\equiv \{V \in \text{Pow}(G \times G). \exists U \in \mathcal{N}_0. \{\langle s, t \rangle \in G \times G. (-s) + t \in U\} \subseteq V\}$ 

```

Definition of right uniformity

```

definition (in topgroup) rightUniformity
  where rightUniformity  $\equiv \{V \in \text{Pow}(G \times G). \exists U \in \mathcal{N}_0. \{\langle s, t \rangle \in G \times G. s + (-t) \in U\} \subseteq V\}$ 

```

Right and left uniformities are indeed uniformities.

```

lemma (in topgroup) side_uniformities:

```

```

    shows leftUniformity {is a uniformity on} G and rightUniformity {is
a uniformity on} G

82 Metamath introduction

theory MMI_prelude imports Order_ZF_1

begin

Metamath's set.mm features a large (over 8000) collection of theorems proven in the ZFC set theory. This theory is part of an attempt to translate those theorems to Isar so that they are available for Isabelle/ZF users. A total of about 1200 assertions have been translated, 600 of that with proofs (the rest was proven automatically by Isabelle). The translation was done with the support of the mmisar tool, whose source is included in the IsarMathLib distributions prior to version 1.6.4. The translation tool was doing about 99 percent of work involved, with the rest mostly related to the difference between Isabelle/ZF and Metamath metalogics. Metamath uses Tarski-Megill metalogic that does not have a notion of bound variables (see http://planetx.cc.vt.edu/AsteroidMeta/Distinctors_vs_binders for details and discussion). The translation project is closed now as I decided that it was too boring and tedious even with the support of mmisar software. Also, the translated proofs are not as readable as native Isar proofs which goes against IsarMathLib philosophy.

82.1 Importing from Metamath - how is it done

We are interested in importing the theorems about complex numbers that start from the "recnt" theorem on. This is done mostly automatically by the mmisar tool that is included in the IsarMathLib distributions prior to version 1.6.4. The tool works as follows:

First it reads the list of (Metamath) names of theorems that are already imported to IsarMathlib ("known theorems") and the list of theorems that are intended to be imported in this session ("new theorems"). The new theorems are consecutive theorems about complex numbers as they appear in the Metamath database. Then mmisar creates a "Metamath script" that contains Metamath commands that open a log file and put the statements and proofs of the new theorems in that file in a readable format. The tool writes this script to a disk file and executes metamath with standard input redirected from that file. Then the log file is read and its contents converted to the Isar format. In Metamath, the proofs of theorems about complex numbers depend only on 28 axioms of complex numbers and some basic logic and set theory theorems. The tool finds which of these dependencies are not known yet and repeats the process of getting their statements from Metamath as with the new theorems. As a result of this process mmisar creates files `new_theorems.thy`, `new_deps.thy` and `new_known_theorems.txt`. The file `new_theorems.thy` contains the theorems (with proofs) imported from Metamath in this session. These theorems are added (by hand) to the current `MMI_Complex_ZF_x.thy` file. The file `new_deps.thy` contains the statements of new dependencies with generic proofs "by auto". These are added to the `MMI_logic_and_sets.thy`. Most of the dependencies can be proven automatically by Isabelle. However, some manual work has to be done for the dependencies that Isabelle can not prove by itself and to correct problems related to the fact that Metamath uses a metalogic based on distinct variable constraints (Tarski-Megill metalogic), rather than an explicit notion of free and bound variables.

The old list of known theorems is replaced by the new list and mmisar is ready to convert the next batch of new theorems. Of course this rarely works in practice without tweaking the mmisar source files every time a new batch is processed.

82.2 The context for Metamath theorems

We list the Metamath's axioms of complex numbers and define notation here.

The next definition is what Metamath $X \in V$ is translated to. I am not sure why it works, probably because Isabelle does a type inference and the "=" sign indicates that both sides are sets.

definition

```
IsASet :: i=>o ( _ isASet [90] 90) where
```

```
IsASet_def[simp]: X isASet  $\equiv$  X = X
```

The next locale sets up the context to which Metamath theorems about complex numbers are imported. It assumes the axioms of complex numbers and defines the notation used for complex numbers.

One of the problems with importing theorems from Metamath is that Metamath allows direct infix notation for binary operations so that the notation $a f b$ is allowed where f is a function (that is, a set of pairs). To my knowledge, Isar allows only notation $f\langle a, b \rangle$ with a possibility of defining a syntax say $a + b$ to mean the same as $f\langle a, b \rangle$ (please correct me if I am wrong here). This is why we have two objects for addition: one called `caddset` that represents the binary function, and the second one called `ca` which defines the $a + b$ notation for `caddset` $\langle a, b \rangle$. The same applies to multiplication of real numbers.

Another difficulty is that Metamath allows to define sets with syntax $\{x|p\}$ where p is some formula that (usually) depends on x . Isabelle allows the set comprehension like this only as a subset of another set i.e. $\{x \in A.p(x)\}$. This forces us to have a slightly different definition of (complex) natural numbers, requiring explicitly that natural numbers is a subset of reals. Because of that, the proofs of Metamath theorems that reference the definition directly can not be imported.

83.1 Basic Metamath theorems

This section contains Metamath theorems that the more advanced theorems from `MMIsar.thy` depend on. Most of these theorems are proven automatically by Isabelle, some have to be proven by hand and some have to be modified to convert from Tarski-Megill metalogic used by Metamath to one based on explicit notion of free and bound variables.

84 Complex numbers in Metamatah - introduction

```
theory MMI_Complex_ZF imports MMI_logic_and_sets
```

```
begin
```

This theory contains theorems (with proofs) about complex numbers imported from the Metamath's set.mm database. The original Metamath proofs were mostly written by Norman Megill, see the Metamath Proof

Explorer pages for full attribution. This theory contains about 200 theorems from "recnt" to "div11t".

theory MMI_examples imports MMI_Complex_ZF

begin

This theory contains 10 theorems translated from Metamath (with proofs). It is included in the proof document as an illustration of how a translated Metamath proof looks like. The "known_theorems.txt" file included in the IsarMathLib distribution provides a list of all translated facts.

86 Metamath interface

theory Metamath_Interface imports Complex_ZF MMI_prelude

begin

This theory contains some lemmas that make it possible to use the theorems translated from Metamath in a the `complex0` context.

86.1 MMisar0 and complex0 contexts.

In the section we show a lemma that the assumptions in `complex0` context imply the assumptions of the `MMisar0` context. The `Metamath_sampler` theory provides examples how this lemma can be used.

The next lemma states that we can use the theorems proven in the `MMisar0` context in the `complex0` context. Unfortunately we have to use low level Isabelle methods "rule" and "unfold" in the proof, `simp` and `blast` fail on the order axioms.

```

87 Metamath sampler

theory Metamath_Sampler **imports** Metamath_Interface MMI_Complex_ZF_2

begin

The theorems translated from Metamath reside in the `MMI_Complex_ZF`, `MMI_Complex_ZF_1` and `MMI_Complex_ZF_2` theories. The proofs of these theorems are very verbose and for this reason the theories are not shown in the proof document or the FormaMath.org site. This theory file contains some examples of theorems translated from Metamath and formulated in the `complex0` context. This serves two purposes: to give an overview of the material covered in the translated theorems and to provide examples of how to take a translated theorem (proven in the `MMIisar0` context) and transfer it to the `complex0` context. The typical procedure for moving a theorem from `MMIisar0` to `complex0` is as follows: First we define certain aliases that map names defined in the `complex0` to their corresponding names in the `MMIisar0` context. This makes it easy to copy and paste the statement of the theorem as displayed with `ProofGeneral`. Then we run the Isabelle from `ProofGeneral` up to the theorem we want to move. When the theorem is verified `ProofGeneral` displays the statement in the raw set theory notation, stripped from any notation defined in the `MMIisar0` locale. This is what we copy to the proof in the `complex0` locale. After that we just can write "then have ?thesis by simp" and the simplifier translates the raw set theory notation to the one used in `complex0`.

87.1 Extended reals and order

In this section we import a couple of theorems about the extended real line and the linear order on it.

Metamath uses the set of real numbers extended with $+\infty$ and $-\infty$. The $+\infty$ and $-\infty$ symbols are defined quite arbitrarily as \mathbb{C} and $\{\mathbb{C}\}$, respectively. The next lemma that corresponds to Metamath's `renfdisj` states that $+\infty$ and $-\infty$ are not elements of \mathbb{R} .

```
lemma (in complex0) renfdisj: shows  $\mathbb{R} \cap \{+\infty, -\infty\} = \emptyset$ 
proof -
  let real =  $\mathbb{R}$ 
  let complex =  $\mathbb{C}$ 
  let one = 1
  let zero = 0
  let iunit = i
  let caddset = CplxAdd(R,A)
  let cmulset = CplxMul(R,A,M)
  let lessrrel = StrictVersion(CplxROrder(R,A,r))
  have MMIisar0
    (real, complex, one, zero, iunit, caddset, cmulset, lessrrel)
    using MMIisar_valid by simp
  then have real  $\cap \{\text{complex}, \{\text{complex}\}\} = \emptyset$ 
    by (rule MMIisar0.MMI_renfdisj)
  thus  $\mathbb{R} \cap \{+\infty, -\infty\} = \emptyset$  by simp
qed
```

The order relation used most often in Metamath is defined on the set of complex reals extended with $+\infty$ and $-\infty$. The next lemma allows to use Metamath's `xrltso` that states that the $<$ relations is a strict linear order on the extended set.

```
lemma (in complex0) xrltso: shows  $<$  Orders  $\mathbb{R}^*$ 
proof -
  let real =  $\mathbb{R}$ 
  let complex =  $\mathbb{C}$ 
  let one = 1
  let zero = 0
  let iunit = i
  let caddset = CplxAdd(R,A)
  let cmulset = CplxMul(R,A,M)
  let lessrrel = StrictVersion(CplxROrder(R,A,r))
  have MMIisar0
    (real, complex, one, zero, iunit, caddset, cmulset, lessrrel)
    using MMIisar_valid by simp
  then have
    (lessrrel  $\cap$  real  $\times$  real  $\cup$ 
      $\{(\{\text{complex}\}, \text{complex}) \cup \text{real} \times \{\text{complex}\} \cup$ 
      $\{\{\text{complex}\}\} \times \text{real})$  Orders (real  $\cup \{\text{complex}, \{\text{complex}\}\})$ )
    by (rule xrltso)
```

```

    by (rule MMIIsar0.MMI_xrltso)
  moreover have lessrrel  $\cap$  real  $\times$  real = lessrrel

87.2 Natural real numbers

In standard mathematics natural numbers are treated as a subset of real numbers. From the set theory point of view however those are quite different objects. In this section we talk about "real natural" numbers i.e. the counterpart of natural numbers that is a subset of the reals.

Two ways of saying that there are no natural numbers between n and $n + 1$.

lemma (in complex0) no_nats_between:

assumes A1: $n \in \mathbb{N}$ $k \in \mathbb{N}$

shows

$n \leq k \iff n < k+1$

$n < k \iff n + 1 \leq k$

proof -

```

let real =  $\mathbb{R}$ 
let complex =  $\mathbb{C}$ 
let one = 1
let zero = 0
let iunit = i
let caddset = CplxAdd(R,A)
let cmulset = CplxMul(R,A,M)

```

```

let lessrrel = StrictVersion(CplxR0Order(R,A,r))
have I: MMIsar0
  (real, complex, one, zero, iunit, caddset, cmulset, lessrrel)

87.3 Infimum and supremum in real numbers

Real numbers form a complete ordered field. Here we import a couple of Metamath theorems about supremu and infimum.

If a set S has a smallest element, then the infimum of S belongs to it.

lemma (in complex0) lbinfmcl: assumes A1: $S \subseteq \mathbb{R}$ and

A2: $\exists x \in S. \forall y \in S. x \leq y$

shows $\text{Infim}(S, \mathbb{R}, <) \in S$

proof -

let real = \mathbb{R}

let complex = \mathbb{C}

let one = 1

let zero = 0

let iunit = i

let caddset = CplxAdd(R,A)

let cmulset = CplxMul(R,A,M)

let lessrrel = StrictVersion(CplxROrder(R,A,r))

have I: MMI_0

(real, complex, one, zero, iunit, caddset, cmulset, lessrrel)

using MMI_0_valid by simp

then have

$S \subseteq \text{real} \wedge (\exists x \in S. \forall y \in S. \langle y, x \rangle \notin$

$\text{lessrrel} \cap \text{real} \times \text{real} \cup \{\langle \{\text{complex}\}, \text{complex} \rangle\} \cup$

$\text{real} \times \{\text{complex}\} \cup \{\{\text{complex}\}\} \times \text{real}) \longrightarrow$

$\text{Sup}(S, \text{real},$

$\text{converse}(\text{lessrrel} \cap \text{real} \times \text{real} \cup$

$\{\langle \{\text{complex}\}, \text{complex} \rangle\} \cup \text{real} \times \{\text{complex}\} \cup$

$\{\{\text{complex}\}\} \times \text{real})) \in S$

by (rule MMI_0_lbinfmcl)

then have

$S \subseteq \mathbb{R} \wedge (\exists x \in S. \forall y \in S. x \leq y) \longrightarrow$

$\text{Sup}(S, \mathbb{R}, \text{converse}(<)) \in S$ by simp

with A1 A2 show thesis using Infim_def by simp
